of the  
IEEE Power Engineering Society

Approved March 16, 1995  
IEEE Standards Board

**Abstract:** Diagnostic tests and measurements that are performed in the field on oil-immersed power transformers and regulators are described. Whenever possible, shunt reactors are treated in a similar manner to transformers. Tests are presented systematically in categories depending on the subsystem of the unit being examined. A diagnostic chart is included as an aid to identify the various subsystems. Additional information is provided regarding specialized test and measuring techniques.

**Keywords:** Oil filled transformers, regulators, reactors, diagnostic evaluation, off-line testing, field testing, windings, bushings, insulating fluids, tapchangers, core, tanks, safety.

transmission power transformer in the UK from three aspects statistical analysis on historic transformer life data thermal modelling of in service transformers and through the in service transformers furan measurements A detailed statistical analysis shows that deriving the transformer's reliability at a certain age by calculating the hazard rate is inadequate as the hazard rate at each age has a statistical range in which the confidence band width is related to the amount of the reliability data The transformer life data in all ages are grouped together to derive a general hazard rate of 0.27% It is concluded that the transformer life expectancy could not be derived via statistical approaches due to the limited data available at the older transformer ages As an alternative approach regarding the life of insulating paper as the ultimate life of a transformer the thermal model published by the IEC transformer loading guide 60076-7 is reviewed and extended to estimate a transformer's thermal lifetime The model is improved in two aspects such that Arrhenius equation is adopted to consider the paper's practical ageing mechanism of oxidation and hydrolysis when calculating the paper's ageing rate and the model takes consideration of the paper's moisture accumulation effect The developed thermal model is used to reversely derive the generally unknown model input hot spot factor by the means of regarding the scrapped transformer's degree of polymerisation DP predicted thermal lives as a benchmark Assigning the derived hot spot factor to the field units with regard to the design family the thermal lives of 106 in service transformers have been estimated To enlarge the life sample the modelling lives are combined with the 79 scrapped transformers DP predicted thermal lives The thermal life expectancy defined as the median life of the sample set is derived as 88 years A series of sensitivity studies are performed to examine the derived life expectancy's responses on the variations of load winding to oil gradient top oil temperature rise and the setting of winding temperature indicator As a non intrusive approach in transformer's insulating paper assessment the correlations between the 2-furaldehyde 2FAL concentration dissolved in transformer oil and paper's DP derived by different laboratories are reviewed which are found to differ significantly As a first time attempt to derive the 2FAL DP correlation relationship for the field transformers the paper's DP is estimated at the age when oil was sampled using the thermal model and is plotted with the 2FAL measurement De Pablo's equation is found to fit the plot of the DP estimates against the 2FAL measurements better than other function formats The 2FAL concentrations corresponding to the paper's critical DP levels are given using the developed 2FAL DP correlation relationship
