10th ESAFORM Conference on Material Forming Elías Cueto, Francisco Chinesta, 2007-05-10 This book contains papers presented at the 10th Annual ESAFORM Conference which covers the multitude of disciplines related to material forming This year s conference features for the first time an ECCOMAS Thematic conference devoted to new advanced numerical strategies in forming simulation which has been traditionally one of the mini symposia of the conference **Conference Proceedings** Society of Plastics Engineers. Technical Conference, 1993 **Transactions of the Materials Research Society of Japan** , 2002 Issues for 1994 1995 included papers from the IUMRS ICAM issues for 1999 2002 include papers for all the symposia sponsored by the MRSJ *Material Characterization and Modeling of Strain Induced Crystallization in PET Above the Glass Transition Temperature* Gurucharan Chandrasekaran, 2008 Abstract PET is a thermoplastic polymer that is extensively used in the production of packaging material for applications such as drawn fibers bottles and stretched films Its industrial applicability is largely based on the fact that it undergoes strain induced crystallization on deformation just above its glass transition temperature Tg Crystallization imparts increased density stiffness dimensional stability and resistance to permeability However the crystallization process and the mechanical behavior of PET above its Tg is highly dependent on factors such as temperature strain rate and the mode of deformation This makes it necessary to have a reliable material model that can be used in FEM simulations to predict its mechanical behavior This thesis is aimed at achieving two goals i to mechanically characterize three PET PCT blends that have not been previously tested PET00 PET1 5 and PET12 and to do a comparative study of the five PET PCT blends This was done by testing five PET PCT blends over a range of temperatures and strain rates in uniaxial compression and plane strain compression modes ii to modify the Dupaix Krishnan constitutive model to predict the occurrence and effects of strain induced crystallization in PET This involved testing PET and PETG under load hold conditions to identify the criteria that induce crystallization in PET Subsequently the material model was modified by incorporating these criteria Monotonic tests were conducted for the five PET PCT blends PET00 PET1 5 PET3 5 PET12 and PETG at temperatures of 90C and 100C and strain rates of 0 1 s 0 05 s and 0 005 s in uniaxial compression and plane strain compression The experimental results were then fit to the Dupaix Boyce constitutive model for these five blends The model was able to successfully capture the dependence of the material behavior on temperature strain rate and strain state above Tg for the five materials The experimental results were also useful in making a comparison of the mechanical

behavior of the five materials to each other This showed that the behavior of the low PCT content materials were different from that of the high PCT content materials at conditions that favored crystallization Load hold experiments were conducted on PET00 PET3 5 and PETG at temperatures of 90C and 100C and strain rates of 0 1 s and 0 005 s in both uniaxial and plane strain compression The results obtained were similar to that of the monotonic tests as they showed that while PET00 and PET3 5 crystallized at certain favorable conditions PETG did not Therefore it was found that the load hold condition was not one of the factors that lead to crystallization Crystallization occurred in PET only when all of the following conditions were met i high strain rates of 0 1 s and above ii temperatures of 90C 100C iii plane strain compression and iv after a certain amount of deformation Based on these findings changes were made to the Dupaix Krishnan material model to improve its ability to predict the occurrence and effects of strain induced crystallization on the large strain deformation behavior of PET near Tg
