

## **Controlling Noise on Construction Sites**

### **Controlling Construction Noise**

Controlling construction noise can pose special problems for contractors. Unlike paved highways, construction activities are not always stationary and in one location.

Construction activities often take place outside where they can be affected by weather, wind currents, topography, atmosphere and landscaping. Construction noise sources, e.g., heavy earth moving equipment, can move from location to location and is likely to vary considerably in its intensity throughout a work day.

High noise levels on construction activities can be lowered by using commonly accepted engineering and administrative controls. This booklet is filled with tips other contractors and have used to lower the noise levels on construction activities. Normally, earplugs and other types of personal protective equipment (PPE) are used to control a worker's exposure to noisy equipment and work areas. However, as a rule engineering and administrative controls should always be the preferred method of reducing noise levels on activities. Only, when these controls are proven ineffective, earplugs or a permanent solution should be considered).

### **Engineering Controls**

Engineering controls modify the equipment or the work area to make it quieter. Examples of engineering controls are: substituting existing equipment with quieter equipment, retro-fitting existing equipment with damping materials, mufflers, or enclosures; reducing barriers; and maintenance.

### **Administrative Controls**

There are management techniques on work activities, work rotation and work load or "quieter workers" programs to help reduce noise. Typical management techniques that reduce worker exposure, to noise are: moving workers away from the noise source; scheduling quietest or quietest rotating workers performing noisy tasks; and shutting down noisy equipment when not needed.

### **Personal Protective Equipment**

Earplugs are the typical PPE given to workers to reduce their exposure to noise. Earplugs are the easiest of least costly and should only be provided when other means of noise control are ineffective. As a general rule, workers should be using earplugs whenever they are exposed to noise levels of 85 dBA (A) or when they have no choice or need to communicate.
