Corrosion and Electrochemistry of Zinc Xiaoge Gregory Zhang, 2013-06-29 Humankind's use of zinc stretches back to antiquity and it was a component in some of the earliest known alloy systems. Even though metallic zinc was not discovered in Europe until 1746 by Marggrat, zinc ores were used for making brass in biblical times and an 87% zinc alloy was found in prehistoric ruins in Transylvania. Also, zinc the metal was produced in quantity in India as far back as the thirteenth century well before it was recognized as being a separate element. The uses of zinc are manifold ranging from galvanizing to die castings to electronics. It is a preferred anode material in high energy density batteries e.g. Ni-Zn, Ag-Zn, Zn-Air so that its electrochemistry particularly in alkaline media has been extensively explored. In the passive state zinc is photoelectrochemically active with the passive film displaying n-type characteristics. For the same reason that zinc is considered to be an excellent battery anode it has found extensive use as a sacrificial anode for the protection of ships and pipelines from corrosion. Indeed, aside from zinc's well known attributes as an alloying element its widespread use is principally due to its electrochemical properties which include a well placed position in the galvanic series for protecting iron and steel in natural aqueous environments and its reversible dissolution behavior in alkaline solutions.

Nanostructured Anodic Metal Oxides Grzegorz D. Sulka, 2020-03-30 Nanostructured Anodic Metal Oxides: Synthesis and Applications reviews the current status of fabrication strategies that have been successfully developed to generate nanoporous, nanotubular and nanofibrous anodic oxides on a range of metals. The most recent achievements and innovative strategies for the synthesis of nanoporous aluminum oxide and nanotubular titanium oxide are discussed. However, a special emphasis is placed on the possibility of fabrication of nanostructured oxide layers with different morphologies on other metals including aluminum, titanium, tantalum, tin, zinc, zirconium and copper. In addition, emerging biomedical applications of synthesized materials are discussed in detail. During the past decade, great progress has been made both in the preparation and characterization of various nanomaterials and their functional applications. The anodization of metals has proven to be reliable for the synthesis of nanoporous, nanotubular and nanofibrous metal oxides to produce a desired diameter, density, aspect ratio, length to diameter of pores, tubes and internal pore tube structure.

Electrochemistry and Corrosion Science is a graduate level text professional reference that describes the types of corrosion on metallic materials The focus will be on modeling and engineering approximation schemes that describe the thermodynamics and kinetics of electrochemical systems The principles of corrosion behavior and metal recovery are

succinctly described with the aid of pictures figures graphs and schematic models followed by derivation of equations to quantify relevant parameters Example problems are included to illustrate the application of electrochemical concepts and mathematics for solving complex corrosion problems This book differs from others in that the subject matter is organized around the modeling and predicating approaches that are used to determine detrimental and beneficial electrochemical events Thus this book will take a more practical approach and make it especially useful as a basic text and reference for professional engineers

Modern Metals in Cultural Heritage Virginia Costa, 2019-07-16 This practical guide provides artists conservators curators and other heritage professionals with tools for understanding evaluating and approaching the care and treatment of modern metals The proliferation of new metals such as stainless steels aluminum alloys and metallic coatings in modern and contemporary art and architecture has made the need for professionals who can address their conservation more critical than ever This volume seeks to bridge the gap between the vast technical literature on metals and the pressing needs of conservators curators and other heritage professionals without a metallurgy background It offers practical information in a simple and direct way enabling curators conservators and artists alike to understand and evaluate the objects under their care This invaluable reference reframes information formerly found only in specialized technical and industrial publications for the context of cultural heritage conservation As the first book to address the properties testing and maintenance issues of the hundreds of metals and alloys available since the beginning of the twentieth century it is destined to become an essential resource for conservators artists fabricators curators collectors and anyone working with modern metals
