Ward,2020-08-20 Forlagets beskrivelse In this fifth edition of Principles of Exercise Testing and Interpretation as in earlier editions we attempt to develop conceptual advances in the physiology and pathophysiology of exercise particularly as related to the practice of medicine The underlying theme of the book continues to be the recognition that the most important requirement for exercise performance is transport of oxygen to support the bioenergetic processes in the muscle cells including of course the heart and elimination of the carbon dioxide formed as a byproduct of exercise metabolism Thus appropriate cardiovascular and ventilatory responses are required to match those of muscle respiration in meeting the energy demands of exercise As depicted by the logo on the book cover normal exercise performance requires an efficient coupling of external to internal cellular respiration Appropriate treatment of exercise intolerance requires that patients symptoms be thought of in terms of a gas exchange defect between the cell and the environment The defect may be in the lungs heart peripheral or pulmonary circulations the muscles themselves or there may be a combination of defects Thus we describe the pathophysiology in gas transport and exchange that affect any site in the cardio respiratory coupling between the lungs and the muscles We illustrate how cardiopulmonary exercise testing can provide the means for a critical evaluation by the clinician scientist of the functional competency of each component in the coupling of cellular to external respiration including the cardiovascular system To achieve this clinical cases are used to
