Abstract. We analyze the joint convergence of sequences of discounted stock prices and Radon-Nikodym derivatives of the minimal martingale measure when interest rates are stochastic. Therefrom we deduce the convergence of option values in either complete or incomplete markets. We illustrate the general result by two main examples: a discrete time i.i.d. approximation of a Merton type pricing model for options on stocks and the trinomial tree of Hull and White for interest rate derivatives.

Key words: Weak convergence, incomplete market, option pricing, minimal martingale measure, stochastic interest rate, trinomial tree

1 Introduction

In this paper, we consider the convergence of discrete time pricing models to continuous time models. The markets may be either complete or incomplete, and are made of a financial asset and a money market account. The money market account is obtained from a money unit invested at the initial date and rolled over at the successive instantaneous interest rates. Its price is used as discount factor.

Approach to Option Pricing Christophe Chorro, Dominique Guégan, Florian Ielpo, 2014-12-04

The current world financial scene indicates at an intertwined and interdependent relationship between financial market activity and economic health. This book explains how the economic messages delivered by the dynamic evolution of financial asset returns are strongly related to option prices. The Black Scholes framework is introduced and by underlining its shortcomings an alternative approach is presented that has emerged over the past ten years of academic research: an approach that is much more grounded on a realistic statistical analysis of data rather than on ad hoc tractable continuous time option pricing models. The reader then learns what it takes to understand and implement these option pricing models based on time series analysis in a self contained way. The discussion covers modeling choices available to the quantitative analyst as well as the tools to decide upon a particular model based on the historical datasets of financial returns. The reader is then guided into numerical deduction of option prices from these models and illustrations with real examples are used to reflect the accuracy of the approach using datasets of options on equity indices.

Option Pricing in Discrete-Time Incomplete Market Models Lukasz

Stettner, 2001. Various aspects of pricing of contingent claims in discrete time for incomplete market models are studied.

Formulas for prices with proportional transaction costs are obtained. Some results concerning pricing with concave

transaction costs are shown. Pricing by the expected utility of terminal wealth is also considered.

Option Pricing and Hedging for Discrete Time Regime-Switching Models Bruno Remillard, 2014. We propose optimal mean variance dynamic hedging strategies in discrete time under a multivariate Gaussian regime switching model. The methodology which also performs pricing is robust to time varying and clustering risk observed in financial time series. As such it overcomes the main theoretical drawbacks of the Black Scholes model. To support our approach we provide univariate pricing results for monthly S P 500 vanilla options. Then we present the associated out of sample hedging results in the context of harvesting the implied versus realized volatility premium. Using the proposed methodology the Sharpe ratio derived from the strategy doubles over the classical Black Scholes delta hedging methodology.
