Concurrent, Real-Time and Distributed Programming in Java Badr Benmammar, 2017-12-27 This book provides an introduction to concurrent real time distributed programming with Java object oriented language support as an algorithm description tool It describes in particular the mechanisms of synchronization cooperative and competitive and sharing of data internal class static variables between threads in Java He

then discusses the use of Java for real time applications Consequently a presentation of the RTSJ Real Time Specification for Java specification dedicated to the development of real time applications in Java is also introduced in this book Finally a presentation of programming distributed in Java is presented in this book We are particularly interested in communication using the TCP Sockets and high level communication using Java Remote Method Invocation RMI The book also contains an annex which contains a practical set of application exercises in relation to the theme of the book Knowledge of the Java language is a prerequisite for understanding the book

Distributed Computing M. L. Liu, Mei-Ling L. Liu, 2004

Distributed Computing provides an introduction to the core concepts and principles of distributed programming techniques It takes a how to approach where students learn by doing Designed for students familiar with Java the book covers programming paradigms protocols and application program interfaces API s including RMI COBRA IDL WWW and SOAP Each chapter introduces a paradigm and or protocol and then presents the use of a DPI that illustrates the concept The presentation uses narrative code examples and diagrams designed to explain the topics in a manner that is clear and concise End of chapter exercises provide analytical as well as hands on exercises to prompt the reader to practice the concepts and the use of API s covered throughout the text Using this text students will understand and be able to execute basic distributed programming techniques used to create network services and network applications including Internet applications

Introduction to Reliable Distributed Programming Rachid Guerraoui, Luís Rodrigues, 2006-05-01 In modern computing a program is usually distributed among several processes The fundamental challenge when developing reliable distributed programs is to support the cooperation of processes required to execute a common task even when some of these processes fail Guerraoui and Rodrigues present an introductory description of fundamental reliable distributed programming abstractions as well as algorithms to implement these abstractions The authors follow an incremental approach by first introducing basic abstractions in simple distributed environments before moving to more sophisticated abstractions and more challenging environments Each core chapter is devoted to one specific class of abstractions covering reliable delivery shared memory consensus and various forms of agreement This textbook comes with a companion set of running examples implemented in Java These can be used by students to get a better understanding of how reliable distributed programming abstractions can be implemented and used in practice Combined the chapters deliver a full course on reliable distributed programming The book can also be used as a complete reference on the basic elements required to build reliable distributed applications

Java Distributed Computing Jim Farley, 1998 This book shows how to build software in which two or more computers cooperate to produce results It covers Java s RMI Remote Method Invocation facility in addition to CORBA and strategies for developing a distributed framework It pays attention to often neglected issues such as protocol design security and bandwidth requirements

Java RMI William Grosso, 2002 This text focuses on designing and implementing Java s Remote Method Invocation Novice readers can learn why RMI is such a powerful yet easy to use tool for distributed

Distributed Programming A. Udaya Shankar, 2012-09-15 Distributed Programming Theory and Practice presents a practical and rigorous method to develop distributed programs that correctly implement their specifications The method also covers how to write specifications and how to use them Numerous examples such as bounded buffers distributed locks message passing services and distributed termination detection illustrate the method Larger examples include data transfer protocols distributed shared memory and TCP network sockets Distributed Programming Theory and Practice bridges the gap between books that focus on specific concurrent programming languages and books that focus on distributed algorithms Programs are written in a real life programming notation along the lines of Java and Python with explicit instantiation of threads and programs Students and programmers will see these as programs and not merely algorithms in pseudo code The programs implement interesting algorithms and solve problems that are large enough to serve as projects in programming classes and software engineering classes Exercises and examples are included at the end of each chapter with on line access to the solutions Distributed Programming Theory and Practice is designed as an advanced level text book for students in computer science and electrical engineering Programmers software engineers and researchers working in this field will also find this book useful

Architecture and Design of Distributed Embedded Systems Bernd Kleinjohann, 2013-04-18 Due to the decreasing production costs of IT systems applications that had to be realised as expensive PCBs formerly can now be realised as a system on chip Furthermore low cost broadband communication media for wide area communication as well as for the realisation of local distributed systems are available Typically the market requires IT systems that realise a set of specific features for the end user in a given environment so called embedded systems Some examples for such embedded systems are control systems in cars airplanes houses or plants information and communication devices like digital TV mobile phones or autonomous systems like service or edutainment robots For the design of embedded systems the designer has to tackle three major aspects The application itself including the man machine interface The target architecture of the system including all functional and non functional constraints and the design methodology including modelling specification synthesis test and validation The last two points are a major focus of this book This book documents the high quality approaches and results that were presented at the International Workshop on Distributed and Parallel Embedded Systems DIPES 2000 which was sponsored by the International Federation for Information Processing IFIP and organised by IFIP working groups WG10.3 WG10.4 and WG10.5 The workshop took place on October 18-19 2000 in Schlo Eringerfeld near Paderborn Germany Architecture and Design of Distributed Embedded Systems is organised similar to the workshop Chapters 1 and 4 Methodology I and II deal with different modelling and specification paradigms and the corresponding design methodologies Generic system architectures for different classes of embedded systems are presented in Chapter 2 In Chapter 3 several design environments for the support of specific design methodologies are presented Problems concerning test and validation are discussed in Chapter 5 The last two chapters

include distribution and communication aspects Chapter 6 and synthesis techniques for embedded systems Chapter 7 This book is essential reading for computer science researchers and application developers
