Ultra Low Power Capacitive Sensor Interfaces Wouter Bracke, Robert Puers, Chris Van Hoof, 2007-06-15 The increasing performance of smart microsystems merging sensors signal processing and wireless communication promises to have a pervasive impact during the coming decade These autonomous microsystems find applications in sport evaluation health care environmental monitoring and automotive systems They gather data from the physical world convert them to electrical form compensate for interfering variables or non linearities and either act directly on them or transfer it to other systems Most often these sensor systems are developed for a specific application This approach leads to a high recurrent design cost A generic front end architecture where only the sensors and the microcontroller software are customized to the selected application would reduce the costs significantly This work presents a new generic architecture for autonomous sensor nodes The modular design methodology provides a flexible way to build a complete sensor interface out of configurable blocks The settings of these blocks can be optimized according to the varying needs of the application Furthermore the system can easily be expanded with new building blocks The modular system is illustrated in a Generic Sensor Interface Chip GSIC for capacitive sensors Many configuration settings adapt the interface to a broad range of applications The GSIC is optimized for ultra low power consumption It achieves an ON state current consumption of 40 nA

CMOS Capacitive Sensors for Lab-on-Chip Applications Ebrahim Ghafar-Zadeh, Mohamad Sawan, 2010-03-10

1.1 Overview of Lab on Chip Laboratory on Chip LoC is a multidisciplinary approach used for the miniaturization integration and automation of biological assays or procedures in analytical chemistry

1.3 Biology and chemistry are experimental sciences that are continuing to evolve and develop new protocols Each protocol offers step by step laboratory instructions lists of the necessary equipments and required biological and or chemical substances

4.7 A biological or chemical laboratory contains various pieces of equipment used for performing such protocols and as shown in Fig 1.1 the engineering aspect of LoC design is aiming to embed all these components in a single chip for single purpose applications

1.1.1 Main Objectives of LoC Systems Several clear advantages of this technology over conventional approaches including portability full automation ease of operation low sample consumption and fast assays time make LoC suitable for many applications including

Pressure and proximity sensors are widely used in the healthcare and robotics industries Among other applications they are used for patient monitoring and robotic surgery playing an integral role in improving health and safety Currently there is an increasing demand for highly specialized sensors within these industries but the path of designing such sensors can be very circular requiring multiple redesigns To better address this challenge the process must be linearized by enabling more targeted sensor design To achieve targeted design of sensors for specialized applications there are five major objectives 1 better understanding of current sensor technologies 2 more reliable and reproducible sensor fabrication methods 3 simple models to predict sensor performance 4 design rules based on computational and experimental results to inform targeted sensor design and 5 proven efficacy of the targeted design for specific applications This dissertation goes through this process specifically for capacitive pressure and proximity sensors Micro engineered pressure sensors are of particular interest because of their high sensitivity fast response and low limits of detection The micro engineering techniques include micropatterned structures porous layers multilayered packed structures and combined approaches and are compared in terms of ease of fabrication active layer uniformity shape and size versatility and tunability and scalability Understanding the current sensor technologies advantages of different sensor types and fabrication methods led to a focus on capacitive pressure sensors with micropatterned structures The fabrication method for capacitive pressure sensors was improved for consistency and reliability by introducing a lamination layer to anchor the micropatterned structures pyramids in this case to the second electrode A series of equations modeling the dielectric layer as both a spring and electrical circuit was developed to predict sensor response and was confirmed experimentally This model was then used to predict how a variety of design parameters impacted the sensitivity and initial capacitance of the sensor Further the model was expanded to include alternative microstructure geometries and more performance parameters enabling a more extensive comparison of microstructure design Once the dielectric layer of capacitive pressure sensors was better understood an analysis of the effects of electrode design was investigated specifically for fringe field capacitive sensors capable of both pressure and proximity sensing Four novel electrode designs were compared to a traditional parallel plate design All fringe field designs had proximity sensing capabilities distinguish between pressure and proximity regimes and distinguish between conductive and insulating materials however only one could recapitulate most of the pressure sensing capabilities of the parallel plate capacitive sensor Finally the newly obtained sensor performance trends were applied to targetedly design a sensor for early

detection and prevention of diseases after surgical vascular bypass or plaque removal This sensor was effective in vitro in vivo and in a human cadaver without the need to redesign thus demonstrating the efficacy of using the design guidelines developed for linear targeted sensor design **Journal of Micro/nanolithography, MEMS, and MOEMS** ,2008

Automotive Sensors John Turner,2009 This book will help engineers technicians and designers to better understand a wide range of sensors from those based on piezoelectric phenomena through those for thermal and flow measurement to the directional sensors that can inform the driver of his orientation on the road Author John Turner concludes his book with future trends in use of telematic sensing systems for traffic control and traffic automation **IMTC Proceedings** ,1997
