Confectionery Science and Technology Richard W. Hartel, Joachim H. von Elbe, Randy Hofberger, 2017-10-09 This book examines both the primary ingredients and the processing technology for making candies In the first section the chemistry structure and physical properties of the primary ingredients are described as are the characteristics of commercial ingredients The second section explores the processing steps for each of the major sugar confectionery groups while the third section covers chocolate and coatings The manner in which ingredients function together to provide the desired texture and sensory properties of the product is analyzed and chemical reactions and physical changes that occur during processing are examined Trouble shooting and common problems are also discussed in each section Designed as a complete reference and guide Confectionery Science and Technology provides personnel in industry with solutions to the problems concerning the manufacture of high quality confectionery products Science of Sugar Confectionery William P Edwards, 2007-10-31

Confectionery is a topic close to many people s hearts and its manufacture involves some interesting science The confectionery industry is divided into three classes chocolate flour and sugar confectionery It is the background science of this latter category that is covered in The Science of Sugar Confectionery The manufacture of confectionery is not a science based industry as these products have traditionally been created by skilled confectioners working empirically In fact scientific understanding of the production process has only been acquired retroactively Historically however sugar confectionery has had technological synergies with the pharmaceutical industry such as making sugar tablets and applying panned sugar coatings This book gives an introduction to the subject with some basic definitions and commonly used ingredients and then moves on to discuss the chemistry of various types of sugar confectionery These include sugar glasses boiled sweets grained sugar products fondants toffees and fudges hydrocolloids gums pastilles and jellies and concludes with a chapter dedicated to sugar free confectionery **Confectionery and Chocolate Engineering** Ferenc A.

Mohos, 2010-11-29 Confectionery and chocolate manufacture has been dominated by large scale industrial processing for several decades It is often the case though that a trial and error approach is applied to the development of new products and processes rather than verified scientific principles The purpose of this book is to describe the features of unit operations used in confectionary manufacturing In contrast to the common technology focused approach to this subject this volume offers a scientific theoretical account of confectionery manufacture building on the scientific background of chemical engineering The large diversity of both raw materials and end products in the confectionery industry makes it beneficial to approach the subject in this way The industry deals with a variety of vegetable based raw materials as well as milk products eggs gelatin and other animal based raw materials A study of confectionery and chocolate engineering must therefore examine the physical and chemical as well as the biochemical and microbiological properties of the processed materials By characterizing the unit operations of confectionery manufacture the author who has over 40 years experience in confectionery manufacture

aims to open up new possibilities for improvement relating to increased efficiency of operations the use of new materials and new applications for traditional raw materials The book is aimed at food engineers scientists technologists in research and industry as well as graduate students on relevant food and chemical engineering related courses
