The Computational Beauty of Nature Gary William Flake, 2000-01-27 Gary William Flake develops in depth the simple idea that recurrent rules can produce rich and complicated behaviors In this book Gary William Flake develops in depth the simple idea that recurrent rules can produce rich and complicated behaviors Distinguishing agents e g molecules cells animals and species from their interactions e g chemical reactions immune system responses sexual reproduction and evolution Flake argues that it is the computational properties of interactions that account for much of what we think of as beautiful and interesting From this basic thesis Flake explores what he considers to be today s four most interesting computational topics fractals chaos complex systems and adaptation Each of the book s parts can be read independently enabling even the casual reader to understand and work with the basic equations and programs Yet the parts are bound together by the theme of the computer as a laboratory and a metaphor for understanding the universe The inspired reader will experiment further with the ideas presented to create fractal landscapes chaotic systems artificial life forms genetic algorithms and artificial neural networks

The Combinatory Systems Theory Piero Mella, 2025-04-28 This book adopts the logic of Systems Thinking and Control Systems presenting a simple but complete theory called the Theory of Combinatory Systems This new theory describes interprets explains and simulates collective phenomena and their observable effects Such collective phenomena many of which are one way non repeatable or reproducible can all be described and understood using the model as simple as it is general of combinatory systems that is systems formed by collectivities or populations of non connected and unorganized individuals of some species which appear to be directed by an invisible hand that guides the analogous actions of similar individuals in order to produce an emerging collective phenomenon This edition includes enhanced theories such as an analysis of potential interactions between combinatory systems and their dynamics highlighting the role of the environment in which such systems operate It also includes new examples and enhanced figures that illustrate how combinatory systems are observed in social biological and physical contexts

Nature-Inspired Algorithms for Optimisation Raymond Chiong, 2009-04-28 Nature Inspired Algorithms have been gaining much popularity in recent years due to the fact that many real world optimisation problems have become increasingly large complex and dynamic The size and complexity of the problems nowadays require the development of methods and solutions whose

efficiency is measured by their ability to find acceptable results within a reasonable amount of time rather than an ability to guarantee the optimal solution This volume Nature Inspired Algorithms for Optimisation is a collection of the latest state of the art algorithms and important studies for tackling various kinds of optimisation problems It comprises 18 chapters including two introductory chapters which address the fundamental issues that have made optimisation problems difficult to solve and explain the rationale for seeking inspiration from nature The contributions stand out through their novelty and clarity of the algorithmic descriptions and analyses and lead the way to interesting and varied new applications

Largeholder Deforestation and Land Conflict in the Eastern Brazilian Amazon Stephen Peter Aldrich,2009 Over the past thirty years research on land cover and land use change in Amazonia has indicated a number of human environment interactions which have led to extensive deforestation in the world s largest and most diverse standing tropical forest Various underlying socioeconomic causes of deforestation are well explicated in the existing primary literature and include economic development concerns of national security and market influence However to date very little attention has been paid to the potential for social interactions between land managers to drive deforestation in the region This dissertation focuses on one particularly contentious type of interaction land conflict in one of Brazil s most active and controversial deforestation fronts in the South of the state of Par Land conflict in this part of Brazil typically pits largeholder ranchers against the landless poor with conflicts frequently escalating to the occupation of private property and even violent intimidation and murder A number of factors contribute to this violence but among the most important is constitutional law which allows for the expropriation of private property for agrarian reform purposes if land is not

considered productive In the Amazon the most common measure of productivity is the amount of cleared land leading to a significant incentive for deforestation When this constitutional law is combined with a socially organized peasantry largeholders are likely to take extreme measures to protect their property including significant deforestation This work draws from concepts in the land change science literature a rich concept of geographic place and contentious politics in order to describe how conflict could be an underlying driver of deforestation Drawing from this integration of political and ecological considerations I develop a logistic regression model which shows that the social movement organizations which confront wealthy cattle ranchers do so with much greater likelihood on properties displaying various physical and legal characteristics Drawing from the insights provided by this logistic regression model I then specify a spatial error regression model which indicates among other things that land conflict increases the amount of deforestation on largeholdings in the region The data used to develop these models involves an extensive archive of newspaper accounts key informant interviews with a variety of actors on both sides of the ongoing struggle for land geographic information systems and remote sensing Among the chief policy implications of this research is a potential need to rethink the current measure of the productivity of properties in the Amazon to include criteria such as labor conditions number of people employed ecologically responsible use and actual productivity A redefinition of productivity in this way could both limit environmental wrongs and begin to repair the rift between largeholders and the landless laborers of the region p III IV
