Chernousko,1993-11-09 State Estimation for Dynamic Systems presents the state of the art in this field and discusses a new method of state estimation The method makes it possible to obtain optimal two sided ellipsoidal bounds for reachable sets of linear and nonlinear control systems with discrete and continuous time The practical stability of dynamic systems subjected to disturbances can be analyzed and two sided estimates in optimal control and differential games can be obtained The method described in the book also permits guaranteed state estimation filtering for dynamic systems in the presence of external disturbances and observation errors Numerical algorithms for state estimation and optimal control as well as a number of applications and examples are presented The book will be an excellent reference for researchers and engineers working in applied mathematics control theory and system analysis It will also appeal to pure and applied mathematicians control engineers and computer programmers *Optimal and Robust State Estimation* Yuriy S. Shmaliy,Shunyi Zhao,2022-08-02 A unified and systematic theoretical framework for solving problems related to finite impulse response FIR estimate Optimal and Robust State Estimation Finite Impulse Response FIR and Kalman Approaches is a comprehensive investigation into batch state estimators and recursive forms The work begins by introducing the reader to the state estimation approach and provides a brief historical overview Next the work discusses the specific properties of finite impulse response FIR state estimators Further chapters give the basics of probability and stochastic processes discuss the available linear and nonlinear state estimators deal with optimal FIR filtering and consider a limited memory batch and recursive algorithms Other topics covered include solving the q lag FIR smoothing problem introducing the receding horizon RH FIR state estimation approach and developing the theory of FIR state estimation under disturbances The book closes by discussing the theory of FIR state estimation for uncertain systems and providing several applications where the FIR state estimators are used effectively Key concepts covered in the work include A holistic overview of the state estimation approach which arose from the need to know the internal state of a real system given that the input and output are both known Optimal optimal unbiased maximum likelihood and unbiased and robust finite impulse response FIR structures FIR state estimation approach along with the infinite impulse response IIR and Kalman approaches Cost

functions and the most critical properties of FIR and IIR state estimates Optimal and Robust State Estimation Finite Impulse Response FIR and Kalman Approaches was written for professionals in the fields of microwave engineering system engineering and robotics who wish to move towards solving finite impulse response FIR estimate issues in both theoretical and practical applications Graduate and senior undergraduate students with coursework dealing with state estimation will also be able to use the book to gain a valuable foundation of knowledge and become more adept in their chosen fields of study

**A Closed-form Algorithm for Covariance-constrained Optimal Estimation**, 2005 This dissertation describes a new method which results in a closed form solution for constrained optimal state estimation and system identification of discretely measured dynamic systems and illustrates the method for simple examples This post experiment optimal state estimation method is especially appropriate in the presence of significant model error and or significant measurement error The new approach is robust in the presence of significant measurement noise and capable of estimating accurate states by incorporating the known statistical characteristics of the noisy measurements as constraints The determination of the optimal state estimates is derived from a minimization of a cost functional subject to differential equation constraints and statistical constraints of the noisy measurements Estimation of the state and the dynamic model error are obtained as part of the solution of a jump discontinuous two point boundary value problem associated with the algorithm The resulting state estimates are continuous and optimal in a global sense The dynamic model error terms to be identified are assumed unknown and may take any form including nonlinear The new method presented in this dissertation provides a way of obtaining a closed form solution for determining optimal state estimation with incorporation of the average variance of the discrete state measurement as a constraint in the presence of significant error in the assumed nominal model The weight matrix in the Minimum Model Error algorithm is eliminated since the constraints are incorporated in the problem and satisfied as part of the solution This new constrained approach greatly improves computational speed and results in an exact analytical enforcement of the covariance constraint

An Alternative Consideration on Singular Linear State Estimation Y. F. Huang, Eli Fogel, J. B. Thomas, PRINCETON UNIV NJ DEPT OF ELECTRICAL ENGINEERING AND COMPUTER SCIENCE., 1980 The problem of designing an optimal state estimator for a linear discrete time system with a singular noise covariance matrix is considered In this article this problem is cast as a constrained optimization problem and the approach appears to be more direct Solution to this optimization problem gives a reduced order optimal state estimator Author

**Applied State Estimation and Association** Chaw-Bing Chang, Keh-Ping Dunn, 2016-07-08 A rigorous introduction to the theory and applications of state estimation and association an important area

in aerospace electronics and defense industries Applied state estimation and association is an important area for practicing engineers in aerospace electronics and defense industries used in such tasks as signal processing tracking and navigation This book offers a rigorous introduction to both theory and application of state estimation and association It takes a unified approach to problem formulation and solution development that helps students and junior engineers build a sound theoretical foundation for their work and develop skills and tools for practical applications Chapters 1 through 6 focus on solving the problem of estimation with a single sensor observing a single object and cover such topics as parameter estimation state estimation for linear and nonlinear systems and multiple model estimation algorithms Chapters 7 through 10 expand the discussion to consider multiple sensors and multiple objects The book can be used in a first year graduate course in control or system engineering or as a reference for professionals Each chapter ends with problems that will help readers to develop derivation skills that can be applied to new problems and to build computer models that offer a useful set of tools for problem solving Readers must be familiar with state variable representation of systems and basic probability theory including random and stochastic processes

**State Estimation in Linear Systems with Random Parameters** Daniel Sigalov, 2015

*Near-optimal State Estimation for Interconnected Systems* Terry Bernard Cline, IOWA STATE UNIV AMES ENGINEERING RESEARCH INST., 1972 A new algorithm is proposed for estimating the state of a nonlinear stochastic system when only noisy observations of the state are available The state estimation problem is formulated as a modal trajectory maximum likelihood estimation problem The resulting minimization problem is analogous to the nonlinear tracking problem in optimal control theory By viewing the system as an interconnection of lower dimensional subsystems and applying the so called epsilon coupling technique which originated in the study of the sensitivity of control systems to parameter variations a near optimal state estimation algorithm is derived which has the properties that all computations are performed at the subsystem level and only linear equations need to be solved The principal attraction of the method is that significant reductions in the computational requirements relative to other approximate algorithms can be achieved when the system is large dimensional Author
