Proceedings of Third International Conference on Intelligent System Nguyen Hoang Long, João Manuel R. S. Tavares, Souvik Pal, Le Hoang Son, Binh Thai Pham, 2025-08-08 This book gathers selected high quality research papers presented at the Third International Conference on Intelligent System ICIS 2024 organized by University of Transport Technology Hanoi Vietnam during 24 25 October 2024 It discusses high quality and cutting edge research in the areas of informatics intelligent systems and smart technologies and applications The book is a collection of the latest research articles in intelligent control artificial intelligence neural networks knowledge discovery decision support systems soft computing data mining and ontologies machine learning intelligent measurement and other related fields *Power Electronics Handbook* Muhammad H. Rashid, 2011-01-13 Power electronics which is a rapidly growing area in terms of research and applications uses modern electronics technology to convert electric power from one form to another such as ac dc dc dc dc ac and ac ac with a variable output magnitude and frequency It has many applications in our every day life such as air conditioners electric cars sub way trains motor drives renewable energy sources and power supplies for computers This book covers all aspects of switching devices converter circuit topologies control techniques analytical methods and some examples of their applications Designed to appeal to a new generation of engineering professionals Power Electronics Handbook 3rd Edition features four new chapters covering renewable energy energy transmission energy storage as well as an introduction to Distributed and Cogeneration DCG technology including gas turbines gensets microturbines wind turbines variable speed generators photovoltaics and fuel cells has been gaining momentum for quite some time now smart grid technology With this book readers should be able to provide technical design leadership on assigned power electronics design projects and lead the design from the concept to production involving significant scope and complexity Contains 45 chapters covering all aspects of power electronics and its applications Three new chapters now including coverage Energy Sources Energy Storage and Electric Power Transmission Contributions from more than fifty leading experts spanning twelve different countries **Control and Nonlinear Dynamics on Energy Conversion Systems** Herbert Ho-Ching Iu, Abdelali El Aroudi, 2019-07-01 The ever increasing need for higher efficiency smaller size and lower cost make the analysis understanding and design of energy conversion systems extremely important interesting and even imperative One of the most neglected features in the study of such systems is the effect of the inherent nonlinearities on the stability of the system Due to these nonlinearities these devices may exhibit undesirable and complex dynamics which are the focus of many researchers Even though a lot of research has taken place in this area during the last 20 years it is still an active research topic for mainstream power engineers This research has demonstrated that these systems can become unstable with a direct result in increased losses extra subharmonics and even uncontrollability unobservability The detailed study of these systems can help in the design of smaller lighter and less expensive converters that are particularly important in emerging areas of

research like electric vehicles smart grids renewable energy sources and others The aim of this Special Issue is to cover control and nonlinear aspects of instabilities in different energy conversion systems theoretical analysis modelling and practical solutions for such emerging applications In this Special Issue we present novel research works in different areas of the control and nonlinear dynamics of energy conversion systems

Arduino Based Hybrid MPPT Controller for Wind and Solar Michael Assaad, 2017 Renewable power systems are becoming more affordable and provide better options than fossil fuel generation for not only the environment but a benefit of a reduced cost of operation Methods to optimize charging batteries from renewable technologies is an important subject for off grid and micro grids and is becoming more relevant for larger installations Overcharging or undercharging the battery can result in failure and reduction of battery life The Arduino hybrid MPPT controller takes the advantage of solar and wind energy sources by controlling two systems simultaneously The ability to manage two systems with one controller is better for an overall production of energy cost and manageability at a minor expense of efficiency The hybrid MPPT uses two synchronous buck DC DC converters to control both wind and solar The hybrid MPPT performed at a maximum of 93.6% efficiency while the individual controller operated at a maximum 97.1% efficiency when working on the bench test When designing the controller to manage power production from a larger generator the inductor size was too large due to the frequency provided by the Arduino A larger inductor means less allowable current to flow before the inductor becomes over saturated reducing the efficiency of the controller Utilizing a different microcontroller like the PIC16C63A produces a much faster frequency which will reduce the inductor size needed and allow more current before over saturation

Development and Simulation of Maximum Power Point Tracking (MPPT) Controller with Ripple Correlation Control (RCC) for Deep Space Spacecraft Md Sadab Mumtaheen Mahmud, 2020 Solar energy is the main contributor of power in most spacecraft With the growth of power requirements in spacecraft due to complex computational and instrumental needs it is essential that it is equipped with high performance power converters There also exists the challenge of mass and volume constraints for spacecraft hence the power converters must be designed with high power density to meet such demands To design power converters with high power density for space applications radiation hardened gallium nitride GaN semiconductor switches must be used To meet the high power requirements the photovoltaics PV powering the system must also function at its maximum power point MPP Although PV efficiency has increased over time solar irradiance and temperatures can fluctuate dramatically in deep space which causes substantial variations in the MPP of the PV array which can decrease the overall system efficiency Thus it is always imperative to track the MPP of the PV panels to maintain optimal efficiency This thesis establishes GaN as the most suitable device in DC DC converters for space applications and compares it with traditional semiconductor devices To tackle the problem of maximum power point tracking MPPT this thesis shows the development and simulation of a digital MPPT controller which employs the ripple correlation control RCC algorithm It is explained why RCC supersedes the conventional

perturb and observe P the development and simulation of an analog controller is also shown This digital RCC based MPPT controller logic can be ported to any microcontroller to be used as an MPPT controller for DC DC converters with any topology The results show the efficacy of the developed MPPT controller by swiftly and precisely tracking the MPP of the PV array in rapidly changing solar irradiance conditions

Microcontroller-based System Controller for a Hybrid Electric Vehicle John Hsu,2002 Microcontroller Based Supervisory Control of a Solar Tracker Kevin Searle,2017

The Supervisory Control theory SCT of Discrete Event Systems is concerned with the design of supervisors that can generate appropriate control command sequences that meet the plant design specifications Examples of these sequences include the startup and shut down command sequences of a spacecraft engine This thesis addresses the implementation of Supervisory Controller SC executing on microcontroller hardware The plant studied is a 2 degree of freedom solar tracker Existing implementations of Supervisory Control Theory focus on Programmable Logic Controller PLC based systems PLCs are mainly used in process control and manufacturing applications These implementations have proven advantages but suffer from numerous drawbacks The hardware is large expensive and over engineered for many embedded system applications Additionally a number of disconnects between Supervisory Control Theory and their practical application exist These include but are not limited to the Avalanche Effect Inexact Synchronization and Simultaneous Events This thesis extends the application of SCT to the field of microcontroller based embedded systems Methods to minimize or remove the effects of Avalanche Effect Inexact Synchronization and Simultaneous Events are analyzed in a microcontroller based environment Additionally design procedures for the modelling and implementation of a supervisory controller executing within a microcontroller are explored To this end a physical implementation of a real system was created and documented An offline computation of the system supervisor is derived in MATLAB and stored in the system s onboard memory as a State Transition Table STT An optimized storage method is developed that allows for fast execution of state transitions and a low memory footprint
