Environmental Chemistry: Air and Water Pollution Howard Stephen Stoker, Spencer L. Seager, 1972      Air Pollution, 2013-06-05 Environmental Chemistry is a relatively young science Interest in this subject however is growing very rapidly and although no agreement has been reached as yet about the exact content and limits of this interdisciplinary subject there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject One of the first objectives of Environmental Chemistry must be the study of the environment and of natural chemical processes which occur in the environment A major purpose of this series on Environmental Chemistry therefore is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment The industrial activities of man have given a new dimension to Environmental Chemistry We have now synthesized and described over five million chemical compounds and chemical industry produces about one hundred and fifty million tons of synthetic chemicals annually We ship billions of tons of oil per year and through mining operations and other geophysical modifications large quantities of inorganic and organic materials are released from their natural deposits Cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste in relatively small and confined areas Much of the chemical products and waste products of modern society are released into the environment either during production storage transport use or ultimate disposal These released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems      Air Pollution, 2013-06-29 Environmental Chemistry is a relatively young science Interest in this subject however is growing very rapidly and although no agreement has been reached as yet about the exact content and limits of this interdisciplinary discipline there appears to be increasing interest in seeing environmental topics which are based on chemistry embodied in this subject One of the first objectives of Environmental Chemistry must be the study of the environment and of natural chemical processes which occur in the environment A major purpose of this series on Environmental Chemistry therefore is to present a reasonably uniform view of various aspects of the chemistry of the environment and chemical reactions occurring in the environment The industrial activities of man have given a new dimension to Environmental Chemistry We have now synthesized and described over five million chemical compounds and chemical industry produces about hundred and fifty million tons of synthetic chemicals annually We ship billions of tons of oil per year and through mining operations and other geophysical modifications large quantities of inorganic and organic materials are released from their natural deposits Cities and metropolitan areas of up to 15 million inhabitants produce large quantities of waste in relatively small and confined areas Much of the chemical products and waste products of modern society are released into the environment either during production storage transport use or ultimate disposal These released materials participate in natural cycles and reactions and frequently lead to interference and disturbance of natural systems      *Understanding Our Environment* Roy M. Harrison, Royal Society of Chemistry (Great

Britain),1999 This introductory text is aimed at those having little background knowledge of the field Developing a more international approach it emphasises links between atmosphere water and earth      **Air Composition and Chemistry** Peter Brimblecombe,1996 This revised and updated study is about the atmosphere and humanity s influence on it Following an analysis of the natural environment it re examines the sources of air pollution and its effects including decline in health damage to plants and animals indoor pollution and acid rain      **Environmental Chemistry ,      Chemical Principles of Environmental Pollution, Second Edition** Brian Alloway,David C. Ayres,1997-02-13 An authoritative introduction to the scientific principles underlying environmental pollution this book covers the transport toxicity and analysis of pollutants and discusses the major types of contaminant chemicals Students will gain an understanding of the scientific principles of pollution at the chemical level and be able to approach the contentious issues in a rational way Taking a pollution oriented approach the authors discuss legislative limits analysis of metals oestrogenic chemicals indoor and vehicular pollution pesticides dioxin like substances and more      *Air Pollution* ,2013-10-03 An important purpose of The Handbook of Environmental Chemistry is to aid the understanding of distribution and chemical reaction processes which occur in the environment Volume 4 Part B of this series is dedicated to Air Pollution Control Equipment Materials Damage Peroxyacyl Nitrates Semivolatile Compounds in the Atmosphere and Arctic Haze      **Air Pollution and Environmental Health** Pallavi Saxena,Anju Srivastava,2020-06-08 Air pollution is an alarming problem not only in terms of air quality but also in relation to health issues Toxic air pollutant concentrations produce harmful impacts on plant health and human health Further though there are various sources of air pollution anthropogenic and biogenic sources are becoming increasingly problematic A number of control methods have been applied to reduce the air pollutant concentrations so that their global environmental burden on plants as well as humans can be mitigated However as confirmed in numerous reports and studies their concentrations continue to be very high and everyday cases related to air pollution have become exponentially high not only in developing countries but also in developed countries In plants toxic air quality has various adverse effects including biochemical and physiological disorders chronic diseases and or lower yields In humans air pollutants affect the body s metabolism and immune system lungs and central nervous system This book provides an essential overview of air pollution its impacts on plant and human health and potential control strategies The respective chapters cover general monitoring and characterization techniques for air pollutants air quality modelling applications plant and human health effects risk assessment and air pollution control policy Given its scope the book offers a valuable and unique resource for students of Environmental Science Biological Science Medical Science and Agriculture and for environmental consultants researchers and other professionals whose work involves air quality plant and human related research      *Environmental Chemistry for a Sustainable World* Eric Lichtfouse,Jan Schwarzbauer,Didier Robert,2011-11-25 Environmental chemistry is a fast developing science aimed at deciphering fundamental mechanisms ruling the behaviour of pollutants in ecosystems Applying this

knowledge to current environmental issues leads to the remediation of environmental media and to new low energy low emission sustainable processes Chapters review analysis and remediation of pollutants such as greenhouse gases chiral pharmaceuticals dyes chlorinated organics arsenic toxic metals and pathogen in air water plant and soil Several highlights include the overlooked impact of air pollutants from buildings for health risk innovative remediation techniques such as bioreactors for gas treatment electrochemical cleaning of pharmaceuticals sequestration on Fe Mn nodules phytoremediation and photocatalytical inactivation of microbial pathogens This book will be a valuable source of information for engineers and students developing novel applied techniques to monitor and clean pollutants in air wastewater soils and sediments

*Environmental Chemistry* John Moore, 2012-12-02 Environmental Chemistry concerns with the broad interpretation on what environmental chemistry is and discusses chemistry in relation to environmental topics The book is divided into seven parts Part I discusses the origins of different elements and interstellar molecules the development of the earth and the chemical evolution of life Part II talks about energy and its theoretical treatment the origin development and problems related to fossil fuels and the developing energy sources including storage distribution and conservation Part III discusses the air the structure and properties of the atmosphere and air pollution in relation to different industries and transportation Mineral resources and solid wastes are tackled in Part IV and the principles and treatment of water are explained in Part V Part VI discusses the sustenance of life amino acids and the control of toxins and Part VII studies the relationship of science ethics and ecology The text is good for those in the field of chemistry and wish to understand the importance of their field to the environment and for environmentalists and ecologists who want to know the relationship of chemistry with their studies
