Amateur Telescope Making In The Internet Age Finding Parts Getting Help And More The Patrick Moore Practical Astronomy Series:

Amateur Telescope Making in the Internet Age Robert L. Clark, 2010-10-14 Building an astronomical telescope offers the amateur astronomer an exciting challenge with the possibility of ending up with a far bigger and better telescope than could have been afforded otherwise In the past the starting point has always been the grinding and polishing of at least the primary mirror a difficult and immensely time consuming process But now that the Internet has brought us together in a global village purchasing off the shelf goods such as parabolic mirrors eyepieces lenses and telescope tubes is possible There are also a vast number of used mirrors and lenses out there and it is now possible to track them down almost anywhere in the world Online stores and auction houses have facilitated commerce regarding all sorts of useful optical components at a reasonable price This is a book about making telescopes from available parts It provides guidance on where to look and what to look for in selecting items useful for telescope making and explains how to assemble these components to produce an excellent instrument on a tight budget At one time many amateurs made their own telescopes from home made parts In today's rushed world that has almost become a lost art The Internet offers a wonderful alternative to either buying a pricey scope fully assembled or making your own from scratch

Amateur Telescope Making Stephen Tonkin, 2012-12-06 Many amateur astronomers make their own instruments either because of financial considerations or because they are just interested Amateur Telescope Making offers a variety of designs for telescopes mounts and drives which are suitable for the home constructor The designs range from simple to advanced but all are within the range of a moderately well equipped home workshop The book not only tells the reader what he can construct but also what it is sensible to construct given what time is available commercially Thus each chapter begins with reasons for undertaking the project then looks at theoretical consideration before finishing with practical instructions and advice An indication is given as to the skills required for the various projects Appendices list reputable sources of mail order materials and components The telescopes and mounts range from shoestring very cheap instruments to specialist devices that are unavailable commercially

Real Astronomy with Small Telescopes Michael Gainer, 2007-06-04 The small refracting telescope with its simple direct design and construction and permanently aligned optics is the time tested standard for personal use Easily portable it can be taken out of the house and set up at a moment's notice Or it can be packed conveniently into a small car for traveling to a dark observing site With moderate care and minimal maintenance the telescope and mount can last for generations These instruments provide sharp crisp high contrast images of the Moon and planets They are less susceptible to the effects of unstable air than larger ones and because of their low maintenance and durability they are ideal for the parent educator or lifelong learner Until recently however the high cost of small telescopes of sufficient quality for serious astronomical use has limited their accessibility During the past decade innovations in optical design and manufacture have lowered cost and improved quality

Current developments in lens design make it possible to produce affordable refracting telescopes with short tube lengths and greater versatility. The once very costly 90 mm Maksutov-Cassegrain with its optimum combination of effective optics and portability now sells for a modest price. I have often seen small instruments referred to as grab and go or quick look, not worthy of consideration for serious observing. I maintain they can be much more. Despite their limits in types of observation, 80 mm refractors and 90 mm Maksutovs have sufficient aperture and magnifying power to provide a lifetime of observing pleasure. They are ideal for lunar occultation measurements, tracking the solar activity cycle, observing variable stars, and measuring binary stars. Although all the activities described here are equally applicable to larger instruments, none of them require an aperture larger than 80 mm. Through the use of common digital cameras, the limiting stellar magnitude and image scale of small telescopes can be increased dramatically, thus providing results one normally expects from larger instruments. Much of this book applies that principle to making interesting and useful astronomical observations. I have taken novel approaches to extending the use of small instruments for quantitative observations by applying unique methods for the analysis of digital camera photographs.

Care of Astronomical Telescopes and Accessories

M. Barlow
Pepin, 2004-12-17
Commercially made astronomical telescopes are better and less expensive than ever before, and their optical and mechanical performance can be superb. When a good quality telescope fails to perform as well as it might, the reason is quite probably that it needs a little care and attention. Here is a complete guide for anyone who wants to understand more than just the basics of astronomical telescopes and accessories and how to maintain them in the peak of condition. The latest on safely adjusting, cleaning, and maintaining your equipment is combined with thoroughly updated methods from the old masters. Here too are details of choosing new and used optics and accessories along with enhancements you can make to extend their versatility and useful lifetime. This book is for you. Really. Looking after an astronomical telescope isn't only for the experts; although there are some things that only an expert should attempt, and every serious amateur astronomer will find invaluable information here gleaned from Barlow Pepin's many years' experience working with optical instruments.

Building and Using Binoscopes
Norman Butler, 2014-10-25
Provides easy-to-understand information and guidelines about the design and construction of binoscopes. Focusing on both homemade and commercial products, this book provides the reader with simple and straightforward information about the modelling and building of binoscopes. Binoscopes can be thought of as binoculars enlarged to the size of telescopes; essentially a combination of the two. Constructing a binoscope is easier than most people think, but it still demands attention to detail and proper background knowledge. The author goes on to provide additional information about how to understand the products currently on the market should the reader choose to purchase a binoscope instead of building one. Lastly, the book also compares binoscopes with telescopes in great detail, outlining the differences the reader can expect to see in the night sky from using both. The

celestial views obtained with a binoscope compared to a single telescope of the same aperture are a very different experience and well worth the effort **Patrick Moore's practical astronomy series** ,19?? *Amateur Telescope Making* ,1953
