Artificial Intelligence for Arrhythmia Detection and Prediction Evangelos Oikonomou, Polydoros Kampaktsis, Alexios Antonopoulos, Panteleimon Pantelidis, 2025-12-03 Artificial Intelligence AI for arrhythmia detection and prediction represents an emerging field within cardiovascular medicine Despite notable advancements current efforts often fall short in effectively screening and detecting arrhythmias particularly in real time and predictive contexts The proliferation of smartwatches and wearable devices has resulted in vast amounts of data that require precise and efficient processing However the ability to anticipate arrhythmic events before their occurrence remains an elusive goal Recent studies have demonstrated the potential of AI and Deep Learning DL algorithms in improving the accuracy of arrhythmia detection Yet there remains a significant gap in integrating these technologies seamlessly into clinical practice Addressing this gap is crucial for enhancing patient outcomes and advancing the field of cardiovascular medicine This Research Topic aims to explore the transformative potential of AI and DL in the accurate detection and prediction of arrhythmias The primary objective is to investigate how AI can be leveraged to process data from various devices such as 12 lead ECG machines Holter monitors inpatient ECG monitoring devices and wearables to detect arrhythmias before clinical manifestation Specific questions include How can AI algorithms be optimized for real time arrhythmia detection What are the most effective DL methodologies for analyzing diverse data modalities The research will also test hypotheses related to the predictive capabilities of AI in anticipating arrhythmic events To gather further insights into the boundaries of AI for arrhythmia detection and prediction we welcome articles addressing but not limited to the following themes Advanced DL AI methodologies for arrhythmia detection Innovative approaches for analyzing data from diverse modalities Integration of AI algorithms with wearable devices Predictive models for anticipating arrhythmic events Clinical trials and study protocols involving AI in arrhythmia care Systematic reviews of AI applications in cardiovascular medicine Technology and code developments for AI based arrhythmia detection We welcome Original Research Brief Research Report Clinical Trials Study Protocols Systematic Reviews and Technology and Code articles that contribute to the advancement of knowledge in this transformative area of cardiovascular medicine Together let us pave the way for a future where AI plays a pivotal role in predicting and preventing arrhythmias ultimately enhancing patient outcomes and reshaping the landscape of cardiovascular care

Artificial Intelligence for Smart Health: Learning, Simulation, and Optimization Bing Yao, Nathan Gaw, Hyo Kyung Lee, 2025-03-07 With rapid developments in medical sensing and imaging we now live in an era

of data explosion in which large amounts of data are readily available and accessible in the clinical environment. The fast growing biomedical and healthcare data provide unprecedented opportunities for data driven scientific knowledge discovery and clinical decision support. However, it is widely acknowledged that biomedical and healthcare data contain high dimensions, large volumes, missing values, imbalanced classes, heterogeneous sources, multi modalities, and measurement noises. These inherent features pose significant barriers to the translation of data into meaningful clinical actions. Thus, there arises an urgent and compelling need for the development of innovative machine learning simulation and optimization algorithms to cope with the unique challenges associated with biomedical and healthcare data, facilitating the transformation of data into actionable insights for smart health. Our Research Topic aims at catalyzing synergies among biomedical informatics, machine learning, computer simulation, operations research, systems engineering, and other related fields with three specific goals: 1. develop cutting edge data driven models to accelerate scientific knowledge discovery in biomedicine from medical and healthcare data collected from laboratory systems, imaging systems, and medical and sensing devices; 2. develop advanced simulation and calibration algorithms to build personalized digital twins by effectively assimilating patient specific medical data with population level computer models, facilitating precision medical planning; 3. develop innovative optimization algorithms for optimal medical decision making in the face of uncertainty, factors, conflicting objectives, and complex trade offs. This Research Topic will offer a timely collection of information to benefit the researchers and practitioners working in the broad fields of biomedical informatics, healthcare data analytics, medical image processing, and health related artificial intelligence. By harnessing the potential of machine learning, computational simulation, and mathematical optimization techniques, healthcare professionals can effectively analyze and interpret the vast amount of biomedical data available to them, which will ultimately lead to more accurate disease diagnosis, personalized treatment plans, and improved patient outcomes.

Novel Reliable Approaches for Prediction and Clinical Decision-making in Cancer Ines Zidi, Safa Bhar Layeb, Vera Rebmann, 2025-01-14. Cancer is one of the leading causes of death worldwide. Significant advances in the understanding of cancer biology have been reported in the last decade. Many important driving changes, especially immunological deregulations, are implicated in cancer development and progression. These events lead to cancer complexity and heterogeneity in cancer and play a substantial role in pharmacokinetic variability in anticancer therapies. Furthermore, it remains difficult to quantify the prevalence of recurrence and metastasis. Interestingly, omics have shown promising results and are being used to better describe cancer susceptibility, prognosis, and response to treatment. Additionally, researchers are still searching for immunological and other cancer signatures particularly relevant for effective cancer prediction. Emerging data obtained independently are still insufficient to explain the complexity of cancer. Hopefully, new comprehensive systemic and combinatorial approaches will yield benefit in the future and will lead to the development of personalized treatment regimens and improved immunotherapies. In this research topic, we welcome submissions that

propose new panels including and not limited to immunological information cytokines signal transduction pathways involving immune receptors immune tolerance molecules extracellular vesicles immune cells etc genetic information related to genes involved in the deregulation of immune functions eg multi SNP CNV medical history imaging results Authors should present integrative and systemic approaches using clinical data to make reliable predictions of cancer risk and its prognosis and to support cancer treatment management and clinical decision making
