Representation Theory Alexander Zimmermann, 2014-08-15 Introducing the representation theory of groups and finite dimensional algebras first studying basic non commutative ring theory this book covers the necessary background on elementary homological algebra and representations of groups up to block theory It further discusses vertices defect groups Green and Brauer correspondences and Clifford theory Whenever possible the statements are presented in a general setting for more general algebras such as symmetric finite dimensional algebras over a field Then abelian and derived categories are introduced in detail and are used to explain stable module categories as well as derived categories and their main invariants and links between them Group theoretical applications of these theories are given such as the structure of blocks of cyclic defect groups whenever appropriate Overall many methods from the representation theory of algebras are introduced Representation Theory assumes only the most basic knowledge of linear algebra groups rings and fields and guides the reader in the use of categorical equivalences in the representation theory of groups and algebras As the book is based on lectures it will be accessible to any graduate student in algebra and can be used for self study as well as for classroom use

Representations of Algebras José-Antonio de la Peña, 2022-10-22 This book offers an original introduction to the representation theory of algebras suitable for beginning researchers in algebra It includes many results and techniques not usually covered in introductory books some of which appear here for the first time in book form The exposition employs methods from linear algebra spectral methods and quadratic forms as well as categorical and homological methods module categories Galois coverings Hochschild cohomology to present classical aspects of ring theory under new light This includes topics such as rings with several objects the Harada Sai lemma chain conditions and Auslander Reiten theory Noteworthy and significant results covered in the book include the Brauer Thrall conjectures Drozd's theorem and

criteria to distinguish tame from wild algebras This text may serve as the basis for a second graduate course in algebra or as an introduction to research in the field of representation theory of algebras The originality of the exposition and the wealth of topics covered also make it a valuable resource for more established researchers

The Block Theory of Finite Group Algebras: Volume 2 Markus Linckelmann, 2018-05-24 This is a comprehensive introduction to the modular representation theory of finite groups with an emphasis on block theory The two volumes take into account classical results and concepts as well as some of the modern developments in the area Volume 1 introduces the broader context starting with general properties of finite group algebras over commutative rings moving on to some basics in character theory and the structure theory of algebras over complete discrete valuation rings In Volume 2 blocks of finite group algebras over complete p local rings take centre stage and many key results which have not appeared in a book before are treated in detail In order to illustrate the wide range of techniques in block theory the book concludes with chapters classifying the source algebras of blocks with cyclic and Klein four defect groups and relating these classifications to the open conjectures that drive block theory

Local Representation Theory J. L. Alperin, Jonathan L. Alperin, 1993-09-24 The aim of this text is to present some of the key results in the representation theory of finite groups In order to keep the account reasonably elementary so that it can be used for graduate level courses Professor Alperin has concentrated on local representation theory emphasising module theory throughout In this way many deep results can be obtained rather quickly After two introductory chapters the basic results of Green are proved which in turn lead in due course to Brauer's First Main Theorem

A proof of the module form of Brauer's Second Main Theorem is then presented followed by a discussion of Feit's work connecting maps and the Green correspondence. The work concludes with a treatment new in part of the Brauer-Dade theory. As a text, this book contains ample material for a one semester course. Exercises are provided at the end of most sections; the results of some are used later in the text. Representation theory is applied in number theory, combinatorics, and in many areas of algebra. This book will serve as an excellent introduction to those interested in the subject itself or its applications.

Geometry and Representation Theory of Real and p -adic groups Juan Tirao, 1998. The representation theory of Lie groups plays a central role in both classical and recent developments in many parts of mathematics and physics. In August 1995 the Fifth Workshop on Representation Theory of Lie Groups and its Applications took place at the Universidad Nacional de Córdoba in Argentina. Organized by Joseph Wolf, Nolan Wallach, Roberto Miatello, Juan Tirao, and Jorge Vargas, the workshop offered expository courses on current research and individual lectures on more specialized topics. The present volume reflects the dual character of the workshop. Many of the articles will be accessible to graduate students and others entering the field. Here is a rough outline of the mathematical content. The editors beg the indulgence of the readers for any lapses in this preface in the high standards of historical and mathematical accuracy that were imposed on the authors of the articles. Connections between flag varieties and representation theory for real reductive groups have been studied for almost fifty years, from the work of Gelfand and Naimark on principal series representations to that of Beilinson and Bernstein on localization. The article of Wolf provides a detailed introduction to the analytic side of these developments. He describes the construction of standard tempered representations in terms of square integrable partially harmonic forms on certain real group orbits on a flag variety and outlines the ingredients in the Plancherel formula. Finally, he describes recent work on the complex geometry of real group orbits on partial flag varieties.

Representations and Cohomology: Volume 1, Basic Representation Theory of Finite Groups and Associative Algebras D. J. Benson, 1998-06-18. An introduction to modern developments in the representation theory of finite groups and associative algebras. *Selected Works of Maurice Auslander* Maurice Auslander, 1999. Auslander made contributions to many parts of algebra, and this 2 volume set is the set. ISBN is 0 8218 0679 3. Already published, contains a selection of his main work. *Representation Theory of Geigle-Lenzing Complete Intersections* Martin Herschend, Osamu Iyama, Hiroyuki Minamoto, Steffen Oppermann, 2023-05-23. J. Benson, 1991-03-21. This is the first of two volumes providing an introduction to modern developments in the representation theory of finite groups and associative algebras, which have transformed the subject into a study of categories of modules. Thus Dr Benson's unique perspective in this book incorporates homological algebra and the theory of representations of finite dimensional algebras. This volume is primarily concerned with the exposition of the necessary background material, and the heart of the discussion is a lengthy introduction.
