Hodges, 2019 The study of music and the brain can be traced back to the work of Gall in the 18th century continuing with John Hughlings Jackson August Knoblauch Richard Wallaschek and others These early researchers were interested in localizing musicality in the brain and learning more about how music is processed in both healthy individuals and those with dysfunctions of various kinds Since then the research literature has mushroomed especially in the latter part of the 20th and early 21st centuries The Oxford Handbook of Music and the Brain is a groundbreaking compendium of current research on music in the human brain It brings together an international roster of 54 authors from 13 countries providing an essential guide to this rapidly growing field The major themes include Music the Brain and Cultural Contexts Music Processing in The Human Brain Neural Responses to Music Musicianship and Brain Function Developmental Issues in Music and the Brain Music the Brain and Health and the Future Each chapter offers a thorough review of the current status of research literature as well as an examination of limitations of knowledge and suggestions for future advancement and research efforts The book is valuable for a broad readership including neuroscientists musicians clinicians researchers and scholars from related fields but also readers with a general interest in the topic

Sound, Music and Movement in Parkinson's Disease Marta M. N.

Bieńkiewicz, Cathy Craig, 2017-01-05 Recent years have brought new insights to the understanding of Parkinson's disease impact of exercise and sound displays in rehabilitation and movement facilitation There is growing evidence that auditory signals in the environment can provide a temporal template for movement and change the mode of motor control from intrinsic to extrinsic habitual to goal directed enabling enhanced motor performance in patients In addition forced exercise rate studies show that exercising at the pace of healthy adults can have potential neuroprotective benefits for patients Many research groups have explored the use of auditory cues such as rhythmical auditory training in improving gait and upper limb movement parameters Cues are usually either intermittent metronome or continuous dynamic sound displays Similarly dance based interventions suggest that patients benefit from additional sensory information i e the temporal structure embedded in music and proprioceptive information from a dancing partner that facilitates movement On the contrary studies dedicated to auditory perception and motor timing report an impaired ability of patients to perceive and synchronise with complex rhythmical structures i e causing an inability to play musical instruments With the growth of modern technology and the increasing portability of high specification devices such as smart phones new research questions on the design of interventions are beginning to emerge as we strive for more efficient therapeutic approaches In this Research Topic we wanted to bring together top scientists from the movement disorder motor control and sound related studies along with therapists That way we can engage in cross disciplinary and challenging scientific debate about future rehabilitation avenues and frontiers for Parkinson's disease patients

Music, Brain, and Rehabilitation: Emerging Therapeutic Applications and Potential Neural Mechanisms Teppo Särkämö, Eckart Altenmüller, Antoni Rodríguez-Fornells, Isabelle Peretz, 2016-08-05 Music is an important source of enjoyment learning and well being in life as well as a rich powerful and versatile stimulus for the brain With the advance of modern neuroimaging techniques during the past decades we are now beginning to understand better what goes on in the healthy brain when we hear play think and feel music and how the structure and function of the brain can change as a result of musical training and expertise For more than a century music has also been studied in the field of neurology where the focus has mostly been on musical deficits and symptoms caused by neurological illness e g amusia musicogenic epilepsy or on occupational diseases of professional musicians e g focal dystonia hearing loss Recently however there has been increasing interest and progress also in adopting music as a therapeutic tool in neurological rehabilitation and many novel music based rehabilitation methods have been developed to facilitate motor cognitive emotional and social functioning of infants children and adults suffering from a debilitating neurological illness or disorder Traditionally the fields of music neuroscience and music therapy have progressed rather independently but they are now beginning to integrate and merge in clinical neurology providing novel and important information about how music is processed in the damaged or abnormal brain how structural and functional recovery of the brain can be enhanced by music based rehabilitation methods and what neural mechanisms underlie the therapeutic effects of music Ideally this information

can be used to better understand how and why music works in rehabilitation and to develop more effective music based applications that can be targeted and tailored towards individual rehabilitation needs The aim of this Research Topic is to bring together research across multiple disciplines with a special focus on music brain and neurological rehabilitation We encourage researchers working in the field to submit a paper presenting either original empirical research novel theoretical or conceptual perspectives a review or methodological advances related to following two core topics 1 how are musical skills and attributes e g perceiving music experiencing music emotionally playing or singing affected by a developmental or acquired neurological illness or disorder for example stroke aphasia brain injury Alzheimer s disease Parkinson s disease autism ADHD dyslexia focal dystonia or tinnitus and 2 what is the applicability effectiveness and mechanisms of music based rehabilitation methods for persons with a neurological illness or disorder Research methodology can include behavioural physiological and or neuroimaging techniques and studies can be either clinical group studies or case studies studies of healthy subjects are applicable only if their findings have clear clinical implications
