Abstract

The residual effects of bioslurry and composted poultry manure on soil properties and subsequent crop productivity have not yet been studied in detail under humid subtropical conditions of Pakistan. Therefore, field studies were conducted at Gujjar Seed and Nursery Farm, Haripur, Pakistan, during 2012-2013 to determine the residual effects of different nitrogen (N) sources and tillage systems on soil properties and subsequent wheat crop in a randomized-complete-block-design with split-plot arrangement and four replicates. The tillage systems (minimum, conventional and deep) were distributed in main plots, while N sources (bioslurry, poultry manure and chemical fertilizer) with three percentages of recommended N application rates (100, 50 and 25%) that were applied to previous maize crops, were distributed in sub-plots. The results showed that N treatments significantly ($p < 0.05$) affected soil properties (total soil N, available soil phosphorus (P), potassium (K) and soil organic matter (SOM) contents), wheat productivity (plant height, spike length, 1000-grain weight, grain yield and biological yield), and plant N, P and K concentrations in plant shoots at crop harvest. By contrast, tillage systems had a non-significant ($p > 0.05$) effect on all the parameters except SOM contents. The interactive effect of tillage systems and N treatments were significant ($p < 0.05$) on 1000-grain weight, soil total N, soil available P, K, and SOM contents at wheat harvest. It is concluded that application of bioslurry and composted poultry manure has residual effects on the next crop and has potential to increase yield of subsequent crop by reducing the cost of chemical fertilizer.

Innovation in Small-Farm Agriculture Amitava Rakshit, Somsubhra Chakraborty, Manoj Parihar, Vijay Singh Meena, Pradeep Kumar Mishra, Harikesh Bahadur Singh, 2022-05-04 Innovation in Small Farm Agriculture Improving Livelihoods and Sustainability is an invaluable resource focussing on the current state of knowledge and scientific advances about the complex and intertwined issues of innovation and how they relate to livelihood of small scale farmers This book exposes readers with a holistic overview on how agriculture is most associated with the development and transfer of technologies to farmers and their participation in research and development initiatives to improve the relevancy and usefulness of its outputs and innovation which is not well documented The book offers comprehensive coverage of the most essential topics including Recent scientific advances on agricultural innovations for small farmers Emphasizes on opportunities and constraints of techno institutional paradigms Highlight low cost and eco friendly interventions Case studies on various innovations in agriculture spanning the different agricultural gamut *Innovations in Climate Resilient Agriculture* Rajni Rajan, Faheem Ahmad, Kuldeep Pandey, 2025-07-16 This book discusses how modern technology interacts with agriculture soil and plants for the production of robust crops and emphasises aspects of climate change susceptibility adaptation and amelioration for agricultural sustainability Examples of such technologies that could have a significant impact on all facets of sustainably increasing agricultural productivity include genome editing gene mapping nanotechnology hydroponics IoT artificial intelligence and UAVs The book also presents the importance of computer modelling using artificial intelligence robotics and other cutting edge methods in the development of climate smart crops for long term food security improvement in vulnerable agricultural systems impacted by climate change The primary audience for the book is professional scientists as well as advanced undergraduates and graduate students It is also intended for the agricultural productivity sector including nanotechnologists plant biotechnologists horticulturists physiologists and agronomists breeders entomologists plant pathologists food policy analysts and agricultural data scientists *Handbook of Energy Management in Agriculture* Amitava Rakshit, Asim Biswas, Deepranjan Sarkar, Vijay Singh Meena, Rahul Datta, 2023-05-15 This handbook provides a holistic overview of different aspects of energy management in agriculture with an orientation to address the sustainable development goals It covers possible applications not only from a technical point of view but also from economic financial social regulatory and political viewpoints Agriculture is one of the most imperative sectors that contribute to the economy across different agro ecologies of the universe with energy inputs in each stage of production from making and applying chemicals to fueling tractors that lay seeds and harvest crops to electricity for animal housing facilities The majority of agricultural research has focused on the use of input production and productivity whereas rational energy budgeting and use remain an overlooked and likely underestimated segment ignored so far while formulating agro ecosystem framework Energy management study is a new frontier of agriculture and is challenging due to complex enterprises spatial temporal

variability exposure to pollution and the predominant effect of the anthropogenic factor on ecology and environment But it is worth taking the challenge considering the important prerequisite role of energy for sustainable development which has been evidenced from increasing research in recent times Of recent origin there are critical in depth studies around the globe assessing the capture and flow of energy in the ecosystem which will help to develop a conceptual framework to incorporate this vital resource in the agriculture management template This book is a state of the art resource for a broad group of readers including a diversity of stakeholders and professionals in universities public energy institutions farmers and farming industry public health and other relevant institutions and the broader public as well

find the zero point The soil chemical and physical characteristics were monitored through a second soil sampling made at the end of 2013 Conservation tillage caused increasing organic matter content and C E C values As for major plant nutrients in soil results were more uncertain Grapevine yield and quality parameters did not show any negative effect when passing from conventional to conservation tillage techniques The trial provided a preliminary positive evaluation of conservation tillage However more years are required to confirm this trend

Baker,1976 Effects of Reduced Tillage on (cash) Crop Yields, Soil Quality and Other Ecosystem Services Martine Trip,Derk van Balen,Kris Huizinga,Wiepie Haagsma,Timo Sprangers,Marie Wesselink,2023 Decreasing soil quality worsened by climate change related weather extremes is prompting the Dutch Ministry of Agriculture s aim for sustainable management of all agricultural soils by 2030 One proposed practice for this goal is reduced tillage which offers potential benefits such as improved soil structure and reduced greenhouse gas emissions However reduced tillage comes with potential drawbacks such as topsoil compaction and yield reduction While global meta analyses mainly focus on effects of reduced tillage in North and South American cash crops like grains maize and soy this long term Dutch farming systems experiment called BASIS is unique in its focus on Dutch small seeded root and tuber crops The BASIS experiment established in 2009 by Wageningen University and Research in Lelystad consists of three organic and two conventional fields with common Dutch crop rotations In BASIS we experiment with three tillage systems conventional tillage with mouldboard plough CT reduced tillage with sub soiling RTS and reduced tillage without sub soiling RT Reduced tillage with shallow ploughing was added RT SPL later in the experiment The experiment employs controlled traffic farming CTF and is a randomized complete block design with four replicates per tillage system and field In the BASIS experiment a system approach is used this allowed for the experiment to be optimized during the project period Effects of reduced tillage on ecosystems services such as yield yield quality and soil quality were investigated Overall reduced tillage systems showed comparable or higher marketable yield for most crops except for fineseeded crops like carrots and onions The Twinrotor tiller seems a viable option in reduced tillage systems to create a finer seedbed and reduce the yield gap of carrots between reduced and conventional tillage The influence of extreme weather conditions on reduced tillage effects varied with yields sometimes higher and sometimes lower compared to conventional tillage Over time the differences in marketable yield between reduced and conventional tillage showed no increasing or decreasing trend For yield quality the difference between gross yield and marketable product there were no significant differences nor discernible trends between the tillage systems with the expedition of carrots which showed a lower yield quality under reduced tillage with larger sized and deformed carrots This was likely caused by cover crop residue and soil aggregate size The impact of reduced soil tillage

on crop quality parameters such as sugar content sugar beet and thousand grain weight cereal crops showed no significant differences between the tillage systems Bulk density showed no differences in the upper 0 10 cm layer but significantly higher values were observed in the deeper 10 20 cm layer for reduced tillage Soil moisture was generally higher for reduced tillage in the upper 0 10 cm layer while conventional tillage exhibited higher moisture in the lower 10 20 cm layer Penetration resistance was consistently greater for reduced tillage particularly in the 10 30 cm layer Despite these soil property differences there was no substantial evidence of decreased yields or root limitations The increased compaction under reduced tillage could potentially enhance soil bearing capacity Reduced tillage leads to higher soil organic matter and carbon content in the upper 0 15 cm layer compared to conventional tillage However in lower layers no significant difference were found Reduced tillage shows minimal impact on soil pH Total nitrogen content is higher in the upper 0 15 cm layer for reduced tillage Other nutrient availabilities are not strongly influenced by tillage systems Mineral nitrogen levels in the soil are very low in this experiment and differences between tillage systems are small Overall reduced tillage increases soil organic matter carbon and nitrogen in the upper layer 0 15 cm with a trend towards higher values in the 0 30 cm layer To summarize the BASIS experiment shows that reduced tillage is a viable option for most of the Dutch crops and indicates a trend towards improved soil quality
