

Introduction

One of the most important objectives of statistical analysis is to obtain a single representative value. The one single value that reads the characteristics of the complex and varied mass of data is called an average or central value. This value always falls between the lowest and the highest values of the data. An average is a process of condensation. The average brushes off the irregularities of a series, levels all differences of the individual items and presents complex and unwieldy data by a significant number. It thus gives a bird's eye view of an aggregate and can be substituted for individual items in further calculations regarding the series. Thus a single value of the variable representing the entire data, which describes the characteristics of the data is called an average of the data (**or statistical Average**). Since the average tends lie centrally with the values of the variable, arranged according to magnitude, it is also called **measure of central tendency** or **measure of location**.

Thus the measure of central tendency or location helps us in knowing the average character of the data under investigation by a single quantity. This is the quantity around which the whole data tends to cluster.

According to **Simpson and Kafka**, "A measure of central tendency is a typical value around which other figures congregate."

Dr. A. L. Bowley has stated as, "An average is purely a mathematical conception, such as the average length of life in a varied population to a particular group, but is only a short way of expressing an arithmetical result."

Croxton and Cowden have expressed the same as, "An average value is a single value within the range of the data that is used to represent all of the value in the series. Since an average is somewhere within the range, of the data, it is also called a measure of central value."

Clark has stated it as, "Average is an attempt to find one single figure to describe whole of figures."

According to **A.E. Waugh**, "An average is a single value selected from a group of values to represent them in some way-a value which is supposed to stand for whole group, of which it is a part, as typical of all the values in the group."

The average occupy an important place in statistics. Many other techniques of statistical analysis depend upon this measure. This is the reason for Dr. Bowley defining Statistics as the science of averages.
