9. Even though it significantly contributed to global photosynthesis, the consumption of CO₂ from living trees doesn't necessarily lessen global warming due to several factors. A lot of the carbon absorbed by trees is later released back into the atmosphere through respiration, decomposition, and forest fires (and more). Deforestation and land use changes disrupt the carbon balance by reducing the amount of forested areas. Furthermore, the carbon stored in living trees represents only a fraction of the carbon cycle, with another significant portion stored in soil and vegetation. Trees' overall impact on reducing global warming is limited.

11. Chloroplasts are said to have originated from endosymbiotic cyanobacteria, which suggests that their ribosomal RNA genes would be more similar to those in currently living photosynthetic prokaryotes. Studies that support this hypothesis would provide evidence for the evolutionary relationship between chloroplasts and cyanobacteria. This suggests that the process of photosynthesis evolved from endosymbiosis, where a photosynthetic prokaryote was engulfed by a eukaryotic cell, leading to the creating of chloroplasts.
12. Wild relatives of soybeans are likely to show a lower figure for photorespiration-induced decrease in photosynthetic output compared to cultivated soybeans. This expectation comes from the fact that wild relatives have gone through less artificial selection for traits associated with domestication, potentially resulting in a more efficient photosynthetic pathway. Wild relatives also might possess adaptations that reduce the effects of photorespiration, which allows them to maintain higher photosynthetic rates under stressful conditions.
13. Photosynthesis in chloroplasts hold the energy of sunlight to convert carbon dioxide and water into glucose, that is a process crucial for sustaining life on earth. Light energy is absorbed by chlorophyll molecules in the thylakoid membranes, which excite electrons and initiate a series of redox reactions. This energy is used to drive the synthesis of ATP and NADPH, which power the Calvin
