

Chemical Reaction Engineering

The rate of a reaction r_A

Since chemical reaction engineering concerns itself with the kinetics of the reaction, we must first define what is meant by the "rate of a reaction".

We define the rate of a reaction for component A as follows: "the amount of moles of A disappearing or being generated per unit time per unit volume is the rate of the reaction, denoted as r_A ".

Equation for Rate

The rate of a reaction is determined by the rate law. For example, for the reaction,

The rate law could look like,

$$-r_A = k[A]$$

Here, $[A]$ means the concentration of A in mol/L. We will use C_A to denote the concentration from now on. So,

$$-r_A = kC_A$$

In this case we say that the reaction is **first order in A**, as the exponent of C_A is 1. The rate law could also look like,

$$-r_A = kC_A^2$$

In this case, the reaction would be second order in A.

The rate law could also look something like this,

$$-r_A = \frac{k_1 C_A}{1 + k_2 C_A}$$

In which case the order would be hard to determine.

Rate for components of a reaction

Given the reaction,

The rate laws for each component are related as,

$$\frac{1}{a} r_A = \frac{1}{b} r_B = \frac{1}{c} r_C = \frac{1}{d} r_D$$

General Mole Balance for a System / Reactor

We now consider a system volume with a species j as shown below:

Figure E-5 : Mole balance on species j in a system volume, V

The mole balance on this system is,

$$[\text{moles of } j \text{ in per unit time}] - [\text{moles of } j \text{ out per unit time}] + [\text{moles of } j \text{ generated per unit time}] = [\text{moles of } j \text{ accumulated per unit time}]$$

$$F_{j0} - F_j + G_j = \frac{dN_j}{dt}$$

If all the properties of a system, such as catalysis concentration, temperature, concentration of species are uniform throughout the volume, then we can write the G_j terms simply as the product of r_j and the system volume V .

$$F_{j0} - F_j + r_j V = \frac{dN_j}{dt}$$

Chemical Reaction Engineering Walas,1995-06-27 Reactors are the basic equipment in any chemical plant This book describes their process design in terms of numerically solved examples It covers numerical techniques analysis of rate data sizes and performances of ideal reactors residence time distributions and performance of non ideal models solid catalyzed reactions behavior of porous catalysts and reactions between multiple phases including biochemical processes The 1 000 plus problems are classified into 54 categories Each of the eight chapters provides definitions and an outline of theory Solutions are presented mostly as graphs or tables Some key theoretical developments are given in problem form The scope is suitable for the first undergraduate course of this topic and for beginning or graduate students as well as review for professional engineers examinations *Fundamentals of Chemical Reaction Engineering* Charles Donald Holland, Rayford Gaines Anthony,1989 Very Good No Highlights or Markup all pages are intact **Classed Subject Catalog** Engineering Societies Library,1966 **Chemical Reaction Engineering** Martin Schmal, José Carlos Pinto,2021-11-09 The first English edition of this book was published in 2014 This book was originally intended for undergraduate and graduate students and had one major objective teach the basic concepts of kinetics and reactor design The main reason behind the book is the fact that students frequently have great difficulty to explain the basic phenomena that occur in practice Therefore basic concepts with examples and many exercises are presented in each topic instead of specific projects of the industry The main objective was to provoke students to observe kinetic phenomena and to think about them Indeed reactors cannot be designed and operated without knowledge of kinetics Additionally the empirical nature of kinetic studies is recognized in the present edition of the book For this reason analyses related to how experimental errors affect kinetic studies are performed and illustrated with actual data Particularly analytical and numerical solutions are derived to represent the uncertainties of reactant conversions in distinct scenarios and are used to analyze the quality of the obtained parameter estimates Consequently new topics that focus on the development of analytical and numerical procedures for more accurate description of experimental errors in reaction systems and of estimates of kinetic parameters have been included in this version of the book Finally kinetics

requires knowledge that must be complemented and tested in the laboratory Therefore practical examples of reactions performed in bench and semi pilot scales are discussed in the final chapter This edition of the book has been organized in two parts In the first part a thorough discussion regarding reaction kinetics is presented In the second part basic equations are derived and used to represent the performances of batch and continuous ideal reactors isothermal and non isothermal reaction systems and homogeneous and heterogeneous reactor vessels as illustrated with several examples and exercises This textbook will be of great value to undergraduate and graduate students in chemical engineering as well as to graduate students in and researchers of kinetics and catalysis
