[illegible]

Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a supervised walking program or a control group. The walking program consisted of 12 weeks of walking, 3 times per week, for 30 minutes per session. The control group consisted of 20 women who did not participate in the walking program. The subjects were assessed at baseline and at 12 weeks for physical and psychological health. The physical health measures included weight, body mass index (BMI), waist circumference, and blood pressure. The psychological health measures included the Beck Depression Inventory (BDI) and the State-Trait Anxiety Inventory (STAI). The results of the study showed that the walking program had a significant positive effect on the physical and psychological health of the subjects. The walking program resulted in a significant decrease in weight, BMI, waist circumference, and blood pressure. The walking program also resulted in a significant decrease in BDI and STAI scores. The control group did not show any significant changes in these measures. The results of this study suggest that a 12-week, low-intensity, supervised walking program can improve the physical and psychological health of sedentary, middle-aged women.

**Abstract** The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The study group consisted of 20 women who were randomly assigned to a supervised walking program, and the control group consisted of 20 women who were randomly assigned to a control group. The study group walked for 30 minutes, three times a week, for 12 weeks. The control group did not exercise. The study group showed significant improvements in physical and psychological health compared to the control group. The study group showed significant improvements in physical health, including increased walking distance, increased walking speed, and decreased heart rate. The study group also showed significant improvements in psychological health, including decreased anxiety and increased self-esteem. The results of this study suggest that a supervised walking program can be an effective intervention for improving the physical and psychological health of sedentary, middle-aged women.
