HYDRO-TURBINE GOVERNING SYSTEM (Reviewed by Dr. R. Thapar)

6.1 Introduction

Governing system or governor is the main controller of the hydraulic turbine. The governor varies the water flow through the turbine to control its speed or power output. Generating units speed and system frequency may be adjusted by the governor.

Governing system as per IEEE std. -75 includes following.

- a) Speed sensing elements
- b) Governor control actuators
- c) Hydraulic pressure supply system
- d) Turbine control servomotors-these are normally supplied as part of turbine

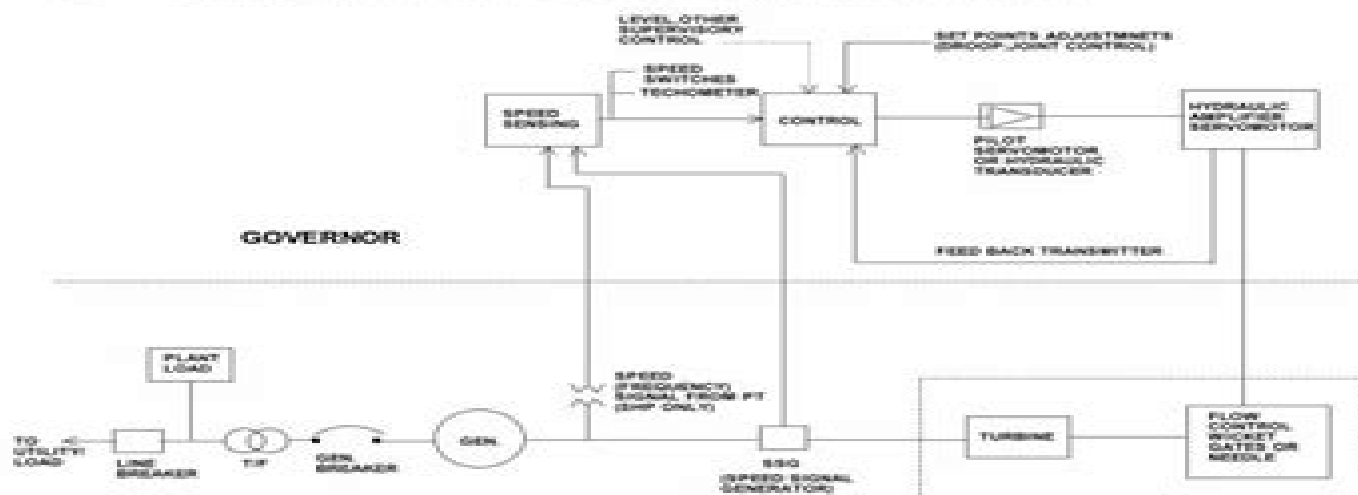

Figure 6.1.: Governing System – Block Diagram (Typical)

The primary functions of the hydraulic turbine governor are as follows:

- i) To start, maintain and adjust unit speed for synchronizing with the running units/grid.
- ii) To maintain system frequency after synchronization by adjusting turbine output to load changes.
- iii) To share load changes with the other units in a planned manner in response to system frequency error.
- iv) To adjust output of the unit in response to operator or other supervisory commands.
- v) To perform normal shut down or emergency over speed shut down for protection.

In isolated systems the governor controls frequency. In large system it may be needed for load operation control for the system. A block diagram is shown in figure 6.1. Digital electronic load governor are now employed. Mechanical analogue electronic governors used in earlier plants are also briefly discussed. In small hydro units digital governors are employed for plant control and protection also which is discussed in detail in Vol. II - Control and Protection.
