Ionic and Covalent Bonding

KEY IDEAS

As you read this section, keep these questions in mind:

- Why do atoms form bonds?
- How do ionic bonds and covalent bonds differ?
- What gives metals their distinctive properties?
- What makes a polyatomic ion different from other ions?

Why Do Chemical Bonds Form?

Atoms form bonds when their valence electrons interact. Recall that atoms with filled outermost energy levels are more stable than atoms with partially filled energy levels. In general, atoms join to form bonds so that each atom has a stable electron configuration. In other words, each atom binds in order to fill its outermost energy levels. 

There are two basic kinds of chemical bonding: ionic bonding and covalent bonding. The type of bonding in a compound determines many of the properties of the compound.

A Comparison of Ionic and Covalent Compounds		
	Ionic compounds	Covalent compounds
Structure	network of bonded ions	molecules
Valence electrons	transferred	shared
Electrical conductivity	good (when melted or dissolved)	poor
State at room temperature	solid	solid, liquid, or gas
Melting and boiling points	generally high	generally low

What Are the Properties of Ionic Bonds?

Ionic bonds form between oppositely charged ions. In general, atoms of metals, such as sodium and calcium, form positively charged ions. Atoms of nonmetals, such as chlorine and oxygen, form negatively charged ions. The attraction between ions with opposite charges holds ionic compounds together. 

READING TOOLBOX

Compare As you read, make a chart that describes and compares the different types of bonds.

Reading Actively in Middle Grade Science Don K. Philpot, 2020-09-15 Middle grade students can learn a great deal about themselves and their world by reading informative texts in science courses These texts will focus on important topics in earth science life science and physical science and shape students understandings about scientific inquiry science related processes and phenomenon engineering and design and technological innovations But reading is a complex act and most students need specific reading related support to understand assigned texts in middle grade science courses This book focuses on the cyclical nature of reading the actions proficient readers engage in to understand science textbooks and other informational texts and the instructional support that teachers can provide to enhance middle grade students learning of science content through reading Three associated questions will be addressed in this book What actions do proficient readers engage in to understand assigned course texts What do these actions entail and how do they relate to each other What teacher mediated practices best support middle grade students development as proficient readers and enhance their learning of course content through reading

Bonding in Electron-Rich Molecules Richard D. Harcourt, 2015-10-30 This second edition was updated to include some of the recent developments such as increased valence structures for 3

electron 3 centre bonding benzene electron conduction and reaction mechanisms spiral chain O4 polymers and recoupled pair bonding The author provides qualitative molecular orbital and valence bond descriptions of the electronic structures for primarily electron rich molecules with strong emphasis given to the valence bond approach that uses increased valence structures He describes how long bond Lewis structures as well as standard Lewis structures are incorporated into increased valence structures for electron rich molecules Increased valence structures involve more electrons in bonding than do their component Lewis structures and are used to provide interpretations for molecular electronic structure bond properties and reactivities Attention is also given to Pauling 3 electron bonds which are usually diatomic components of increased valence structures for electron rich molecules A-level Chemistry E.
