Boranes and Metallaboranes Catherine E. Housecroft, 1994 This concise introduction to boranes and metallaboranes employs an informal and straightforward style The author establishes facts first and rationalization and theories follow Ideas of cluster bonding are presented and the author surveys different approaches to the bonding in clusters emphasizing the use of frontier molecule orbitals and the construction of clusters from fragments The application of spectroscopic techniques to the elucidation of cluster structure is discussed with an emphasis on multinuclear NMR spectroscopy The second edition includes an update on structural data for boranes and their anions Sections on spectroscopy and the reactivity of metallaboranes have been slightly expanded and references have been updated **American Book Publishing Record**, 2005 *Catalysis with Earth-abundant Elements* Uwe Schneider, Stephen Thomas, 2020-10-28 Catalysis remains a key technology in a huge number of industrial processes in the 21st century The catalytic properties of precious metals such as

platinum and palladium are well understood However these metals are expensive and their supply is limited Earth abundant elements such as iron and nickel are as the name suggests in plentiful supply and much cheaper to use but research on their use in catalysis has historically lagged behind As researchers and companies increasingly look for ways to reduce costs and improve the sustainability of their processes there has been a renewed interest in these earth abundant elements This book presents a detailed overview of current research on the catalytic uses of the most Earth abundant elements Highlighting the top ten most Earth abundant elements and their various roles in modern synthetic chemistry s block metals Na K Mg Ca first row transition metals Ti Mn Fe and p block elements Al Si P The significant stoichiometric use of these elements and their use as acid base dual and or redox catalysts will be discussed It will be of use to industrial and academic researchers as well as graduate students with an interest in catalysis and sustainability

Chemistry of Aluminium, Gallium, Indium and Thallium A.J. Downs,1993-05-31 Boron has all the best tunes That may well be the first impression of the Group 13 elements The chemical literature fosters the impression not only in the primary journals but also in a steady outflow of books focussing more or less closely on boron and its compounds The same preoccupation with boron is apparent in the coverage received by the Group 13 elements in the comprehensive and regularly updated volume of the Gmelin Handbook Yet such an imbalance cannot be explained by any inherent lack of variety interest or consequence in the heavier elements Aluminium is the most abundant metal in the earth's crust in the industrialised world the metal is second only to iron in its usage and its compounds can justifiably be said to touch our lives daily to the potential detriment of those and other lives some would argue From being chemical curios gallium and indium have now gained considerably prominence as sources of compound semiconductors like gallium arsenide and indium antimonide Nor is there any want of incident in the chemistries of the heavier Group 13 elements In their redox coordination and structural properties there is to be found music indeed notable not always for its harmony but invariably for its richness and variety This book seeks to redress the balance with a definitive wide ranging and up to date review of the chemistry of the Group 13 metals aluminium gallium indium and thallium

Chemical Research Faculties ,1984 Inorganic chemistry Catherine E.
