Introduction Computing Algorithms Russel Shackelford:

Introduction to Computing and Algorithms Russell L. Shackelford, 1999 Introduction to Computing and Algorithms prepares students for the world of computing by giving them a solid foundation in the study of computer science algorithms. By taking an algorithm based approach to the subject this book helps readers grasp overall concepts rather than getting them bogged down with specific syntax details of a programming language that can become obsolete. Students work with algorithms from the start and apply these ideas to real problems that computers can help solve. The benefit of this approach is that students will understand the power of computers as problem solving tools, learn to think like programmers and gain an appreciation of the computer science discipline.

Informatics in Higher Education Fred Mulder, 2016-01-09 This book addresses two main themes. The first is the discipline of informatics. Two major questions will be discussed: how can we obtain and keep track of a systematic and objective overview of the vast landscape in higher informatics education both nationally and internationally, and would it be useful to rationalize and redesign the informatics curricula leading to less fragmentation and more communality. The second theme is the relation between informatics and other disciplines with the following main questions: what informatics do we need to offer a coherent curriculum which suits the needs of the actual information society with respect to specific disciplines; what is relevant in informatics and CIT to provide to others; and what informatics concepts, methods and techniques form the hard core needed in every other discipline.

Curriculum as Contestation Suellen Shay, Tai L. Peseta, 2019-12-18 In 2015 a social movement swept across the South African higher education sector fuelled by the anger of the born free generation, the students born into post apartheid South Africa. The movement found solidarity in other parts of the globe where the past decade has witnessed the rise of student protests in the UK, the US, Chile, Turkey and Hong Kong to name a few. While the demands are specific to national contexts, the underlying obstacles of economic, cultural and political access into higher education are consistent. These protests have put a spotlight on the global academy that like the society of which it is a part is increasingly characterized by inequality. At its core, these movements call for a more socially just higher education system. This call is profoundly dissonant to the dominant neoliberal discourses currently shaping higher education. Against the backdrop of these discourses, there has been an unprecedented pressure on higher education curricula. This edited collection is dedicated to exploring what a socially just curriculum reform agenda might involve. The authors share a commitment to socially just curricula and a concern about the ways in which curricula are deeply implicated in the processes of producing and reproducing inequality. Each chapter opens up a different vista on the contested curriculum space, drawing on a range of theoretical tools. Archer, Bernstein, Giroux and Maton to name a few, to illuminate the contestation. Perhaps even more importantly, they also draw on a range of voices from both inside and outside the academy. This book was originally published as a special issue of *Teaching in Higher Education*.

to programming in a structured language such as Java or C at a level similar to a typical two semester first year university computer science sequence. However no knowledge of any particular such language is necessary. Mathematical prerequisites are modest. Several appendices can be used to fill minor gaps in background knowledge. After finishing this book students should be well prepared for more advanced study of the three topics either for their own sake or as they arise in a multitude of application areas.
