

BANKI-CROSSFLOW SYSTEMS DESIGN GUIDE

1. INTRODUCTION

The design of a micro-hydro system in regards to the selection and sizing of the individual components so that optimum performance is obtained at the chosen site is not trivial. This is especially so where a single turbine is required to perform well over a wide range of head and flow conditions.

Crossflow turbines are often used for these applications. They exhibit good part flow efficiency over a wide range. As well, they are a flexible; both length and diameter can be individually chosen to suit the characteristics of the site.

WalshHydro is an Excel spreadsheet developed by Planetary Power to test designs for its Walsh River range of micro-hydro systems. The name is derived from the Walsh River in Far North Queensland, where the prototype system was installed. The system concept was developed and prototyped in 1991 by Jerry Jeffress and features the integration of custom made Banki-crossflow turbines, with Baldor DC generators and AERL Hydromax DC:DC step down controllers. Subsequent support for these systems including development of **WalshHydro** has been the responsibility of Max Enfield.

WalshHydro can be easily adapted to other micro-hydro design applications, particularly those that include either a crossflow turbine and/or a DC generator. The author encourages its use for other micro-hydro design applications. **WalshHydro** and these notes may be freely disseminated, copied and modified for this purpose. For commercial or educational use it would be appreciated that acknowledgement of the source be given.

2. THE BASICS

2.1 power train

A micro-hydro system is designed to harness the power of flowing water and to deliver electricity in a useable form. It does this by transforming and/or transmitting the power through a series of discrete stages. The stages are collectively known as the "power train".

WalshHydro assumes that the power train comprises the following stages:

1. a crossflow turbine transforms the hydraulic power of flowing water to mechanical rotating shaft power
2. a coupling, usually of the speed increasing type, connects the turbine shaft to the generator shaft
3. a DC generator converts rotating shaft power to DC electric current
4. a transmission line transmits the DC current to a DC:DC step down controller.
5. the DC:DC step down controller provides DC current for battery charging, to be used subsequently either directly or further conditioned into AC power using an inverter.

The systems designer may wish to consider a different design, in which case the spreadsheet can serve as a template, with just the useful parts selected. For example, the spreadsheet can be used just to explore the effect of changing the turbine parameters.
