Henk Jan Bergveld, W.S. Kruijt, P.H.L. Notten, 2002-09-30 *Battery Management Systems Design by Modelling* describes the design of Battery Management Systems BMS with the aid of simulation methods. The basic tasks of BMS are to ensure optimum use of the energy stored in the battery pack that powers a portable device and to prevent damage inflicted on the battery pack. This becomes increasingly important due to the larger power consumption associated with added features to portable devices on the one hand and the demand for longer run times on the other hand. In addition to explaining the general principles of BMS tasks such as charging algorithms and State of Charge SoC indication methods, the book also covers real life examples of BMS functionality of practical portable devices such as shavers and cellular phones. Simulations offer the advantage over measurements that less time is needed to gain knowledge of a battery's behaviour in interaction with other parts in a portable device under a wide variety of conditions. This knowledge can be used to improve the design of a BMS even before a prototype of the portable device has been built. The battery is the central part of a BMS and good simulation models that can be used to improve the BMS design were previously unavailable. Therefore a large part of the book is devoted to the construction of simulation models for rechargeable batteries. With the aid of several illustrations it is shown that design improvements can indeed be realized with the presented battery models. Examples include an improved charging algorithm that was elaborated in simulations and verified in practice and a new SoC indication system that was developed showing promising results. The contents of *Battery Management Systems Design by Modelling* is based on years of research performed at the Philips Research Laboratories. The combination of basic and detailed descriptions of battery behaviour both in chemical and electrical terms makes this book truly multidisciplinary. It can therefore be read both by people with an electro chemical and an electrical engineering background. **Intelec 16th International**

**Telecommunications Energy Conference** IEEE Power Electronics Society, 1994 *Design and Implementation of an Automated Battery Management Platform* Tuna Toksoz, Massachusetts Institute of Technology. Department of Aeronautics and Astronautics, 2012. This thesis describes the design and the implementation of the hardware platform for automated battery management with battery changing capability for autonomous UAV missions with persistency requirement that extends the mission duration beyond the life of a single UAV battery. The platform is tested through a series of missions lasting at least 3 hours to prove it meets design requirements and to show its feasibility. This thesis also provides a method to modify existing scenarios to proactively plan for the battery maintenance so that the overall system performance is increased. The modifications made to the problem definition increased the state space significantly and means of solving a problem of that scale needed to be developed. To address this challenge this thesis extends a previously developed approach called Incremental Feature Dependency Discovery iFDD by allowing to use caches from computer science literature to make conversion from basic features to extended features faster. By doing so this method significantly reduces the computational complexity. **Electrical & Electronics Abstracts**, 1997 High Frequency Apparatus, Design, Construction and
