Corrosion Protection Of Ductile Iron Pipe:

Review of the Bureau of Reclamation's Corrosion Prevention Standards for Ductile Iron Pipe National Research Council, Division on Engineering and Physical Sciences, National Materials Advisory Board, Committee on the Review of the Bureau of Reclamation's Corrosion Prevention Standards for Ductile Iron Pipe, 2009-11-19 Ductile iron pipe DIP was introduced about 50 years ago as a more economical and better performing product for water transmission and distribution. As with iron or steel pipes DIP is subject to corrosion the rate of which depends on the environment in which the pipe is placed. Corrosion mitigation protocols are employed to slow the corrosion process to an acceptable rate for the application. When to use corrosion mitigation systems and which system depends on the corrosivity of the soils in which the pipeline is buried. The Bureau of Reclamation's specification for DIP in highly corrosive soil has been contested by some as an overly stringent requirement necessitating the pipe to be modified from its as-manufactured state and thereby adding unnecessary cost to a pipeline system. This book evaluates the specifications in question and presents findings and recommendations. Specifically the authoring committee answers the following questions: Does polyethylene encasement with cathodic protection work on ductile iron pipe installed in highly corrosive soils? Will polyethylene encasement and cathodic protection reliably provide a minimum service life of 50 years? What possible alternative corrosion mitigation methods for DIP would provide a service life of 50 years?

Standard Guide for External Corrosion Protection of Ductile Iron Pipe Utilizing Polyethylene Encasement Supplemented by Cathodic Protection , Review of the Bureau of Reclamation's Corrosion Prevention Standards for Ductile Iron Pipe National Research Council (U.S.). Committee on the Review of the Bureau of Reclamation's Corrosion Prevention Standards for Ductile Iron Pipe, 2009 Cast iron is a material that was used for years to fabricate pipe for applications such as water transmission and distribution. About 50 years ago ductile iron pipe DIP was introduced as a more economical and better performing product. DIP is similar to cast iron pipe CIP in that it contains several percent carbon distributed as graphite in an iron matrix. However by the addition of small amounts of magnesium and the controlled annealing of DIP the graphite becomes distributed as spherical nodules in DIP whereas it is distributed in the form of flakes in traditional CIP. This microstructure in DIP results in mechanical properties that are superior to those of traditional cast iron. DIP is also centrifugally cast in a steel mold in contrast to the casting of CIP in traditional sand molds with sand cores. As with iron or steel pipes DIP is subject to corrosion the rate of which depends on the environment in which the pipe is placed. Corrosion mitigation protocols that depend on the corrosivity of the soil are employed to slow the corrosion process to an acceptable rate for the application. A popular economical and often effective corrosion mitigation method for DIP in buried applications is the use of polyethylene encasement (PE) consisting of a sheet of polyethylene wrapped around the pipe or a tube of polyethylene sheeting slipped over the pipe at the time of installation. Another protective method is to use bonded dielectric coatings consisting of various polymers applied as coatings on prepared surfaces or wrap tapes with

adhesives on the same prepared surfaces Bonded dielectric coatings are commonly used on steel pipes but are less commonly used on DIP Cathodic protection CP can also be used to protect metal pipes including DIP CP electrochemically protects the metal structure either by imposing a direct current dc electrical potential to the pipeline or by connecting the pipeline to a sacrificial anode made of a more electrochemically active metal The decision to use corrosion mitigation systems and the choice of the system to use for buried DIP depend on the corrosivity of the soils in which the pipeline is buried Many methods of assessing the corrosivity of soils have been developed All use the resistivity of the soil either as the defining parameter or as one parameter in conjunction with others such as the presence or concentration of specific chemical species that foster corrosion Soils with low resistivity are more corrosive than soils with high resistivity
