Creating New Medical Ontologies For Image Annotation A Case Study Springerbriefs In Electrical And Computer Engineering:

Creating New Medical Ontologies for Image Annotation Liana Stanescu, Dumitru Dan Burdescu, Marius Brezovan, Cristian Gabriel Mihai, 2011-12-16 Creating New Medical Ontologies for Image Annotation focuses on the problem of the medical images automatic annotation process which is solved in an original manner by the authors All the steps of this process are described in detail with algorithms experiments and results The original algorithms proposed by authors are compared with other efficient similar algorithms In addition the authors treat the problem of creating ontologies in an automatic way starting from Medical Subject Headings MESH They have presented some efficient and relevant annotation models and also the basics of the annotation model used by the proposed system Cross Media Relevance Models Based on a text query the system will retrieve the images that contain objects described by the keywords **Semantic and Flexible Query**

Processing of Medical Images Using Ontologies Yahia Chabane, 2016 Querying efficiently images using an image retrieval system is a long standing and challenging research problem In the medical domain images are increasingly produced in large quantities due their increasing interests for many medical practices such as diagnosis report writing and teaching This thesis proposes a semantic based gastroenterological images annotation and retrieval system based on a new polyp ontology that can be used to support physicians to decide how to deal with a polyp The proposed solution uses a polyp ontology and rests on an adaptation of standard reasonings in description logic to enable semi automatic construction of queries and image annotation A second contribution of this work lies in the proposition of a new approach for computing relaxed answers of ontological queries based on a notion of an edit distance of a given individual w r t a given query Such a distance is computed by counting the number of elementary operations needed to be applied to an ABox in order to make a given individual a correct answer to a given query The considered elementary operations are adding to or removing from an ABox assertions on atomic concept a negation of an atomic concept or an atomic role The thesis proposes several formal semantics for such query approximation and investigates the underlying decision and optimisation problems

Supporting Engineering Design of Additively Manufactured Medical Devices with Knowledge Management Through Ontologies Thomas Hagedorn,2018 Medical environments pose a substantial challenge for engineering designers They combine significant knowledge demands with large investment for new product development and severe consequences in the case of design failure Engineering designers must contend with an often chaotic environment to which they have limited access and familiarity a user base that is difficult to engage and highly diverse in many attributes and a market structure that often pits stakeholders against one another As medical care in general moves towards personalized models and surgical tools towards less invasive options emerging manufacturing technologies in additive manufacturing offer significant potential for the design of highly innovative medical devices At the same time however these same technologies also introduce yet more challenges to the design process This dissertation presents a knowledge based approach to addressing the existing and emerging challenges of medical device design The approach aims to address these challenges using knowledge captured in a suite of modular ontologies modeling knowledge domains that must be considered in medical device design These include ontologies for understanding clinical context human factors regulation enterprise and manufacturability Together these ontologies support design ideation knowledge capture and design verification These ontologies are subsequently used to formulate a comprehensive knowledge framework for medical device design and to enable an innovative design process Case studies analyzing the design of surgical tools in several medical specialties are used to assess the capabilities of this approach **Large-scale Medical Image Annotation with Quality-controlled**
