Veera Baladandayuthapani

The book cover features a stylized illustration of a DNA double helix structure. The sugar-phosphate backbones are represented by a series of orange, semi-transparent spheres connected by dark lines. The nitrogenous base pairs are shown as dark, pill-shaped structures connecting the two strands. The overall design is modern and scientific, with a focus on the orange and dark tones.

Analysis in Epigenetics Alan Wright,2013 A typical gene expression data set consists of measurements of a large number of gene expressions on a relatively small number of subjects classified according to two or more outcomes for example cancer or non cancer The identification of associations between gene expressions and outcome is a huge multiple testing problem Early approaches to this problem involved the application of thousands of univariate tests with corrections for multiplicity Over the past decade numerous studies have demonstrated that analyzing gene expression data structured into predefined

gene sets can produce benefits in terms of statistical power and robustness when compared to alternative approaches This thesis presents the results of research on gene set analysis In particular it examines the properties of some existing methods for the analysis of gene sets It introduces novel Bayesian methods for gene set analysis A distinguishing feature of these methods is that the model is specified conditionally on the expression data whereas other methods of gene set analysis and IGA generally make inferences conditionally on the outcome Computer simulation is used to compare three common established methods for gene set analysis In this simulation study a new procedure for the simulation of gene expression data is introduced The simulation studies are used to identify situations in which the established methods perform poorly The Bayesian approaches developed in this thesis apply reversible jump Markov chain Monte Carlo RJMCMC techniques to model gene expression effects on phenotype The reversible jump step in the modelling procedure allows for posterior probabilities for activeness of gene set to be produced These mixture models reverse the generally accepted conditionality and model outcome given gene expression which is a more intuitive assumption when modelling the pathway to phenotype It is demonstrated that the two models proposed may be superior to the established methods studied There is considerable scope for further development of this line of research which is appealing in terms of the use of mixture model priors that reflect the belief that a relatively small number of genes restricted to a small number of gene sets are associated with the outcome

On Some Bayesian and Empirical Bayes Procedures for Analyzing Gene Expression Data Demba Fofana, 2016 In this dissertation we propose hybrid testing procedures as a general class of methods that simultaneously addresses the problems of procedure selection and multiple testing At each hierarchical level the results from each testing are summarized as a set of p values and empirical Bayesian probabilities EBPs of the corresponding null hypotheses Prior knowledge of the properties of the primary test statistics is used to construct an algorithm which uses the distributional assumption of the tests to determine weights for combining the EBPs The combined EBPs can be used as a measure of statistical significance that adjusts for multiple testing while accounting for the several assumptions used in the hierarchy of hypothesis testing procedures In the second part of this dissertation we apply the development of the first part for constructing a hybrid testing procedure that incorporates assumptions and information about graphical network relations into the analysis of gene expression data based on the biological knowledge that neighboring genes share biological functions The degree of correlation between genes is taken into account via similar prior probabilities for neighboring genes We show that combining these different elements not only improve statistical power but also provide a better framework through which gene expression can be properly analyzed We use a series of simulations to compare our approach with other published methods and demonstrate that our method has more statistical power
