Structural equation models (SEMs) with latent variables are widely useful for sparse covariance structure modeling and for inferring relationships among latent variables. Bayesian SEMs are appealing in allowing for the incorporation of prior information and in providing exact posterior distributions of unknowns, including the latent variables. In this article, we propose a broad class of semiparametric Bayesian SEMs, which allow mixed categorical and continuous manifest variables while also allowing the latent variables to have unknown distributions. In order to include typical identifiability restrictions on the latent variable distributions, we rely on centered Dirichlet process (CDP) and CDP mixture (CDPM) models. The CDP will induce a latent class model with an unknown number of classes, while the CDPM will induce a latent trait model with unknown densities for the latent traits. A simple and efficient Markov chain Monte Carlo algorithm is developed for posterior computation, and the methods are illustrated using simulated examples, and several applications.

Key Words: Dirichlet process; Factor analysis; Latent class; Latent trait; Mixture model; Nonparametric Bayes; Parameter expansion.

Bayesian Non- and Semi-parametric Methods and Applications Peter Rossi,2014-04-27 This book reviews and develops Bayesian non parametric and semi parametric methods for applications in microeconometrics and quantitative marketing Most econometric models used in microeconomics and marketing applications involve arbitrary distributional assumptions As more data becomes available a natural desire to provide methods that relax these assumptions arises Peter Rossi advocates a Bayesian approach in which specific distributional assumptions are replaced with more flexible distributions based on mixtures of normals The Bayesian approach can use either a large but fixed number of normal components in the mixture or an infinite number bounded only by the sample size By using flexible distributional approximations instead of fixed parametric models the Bayesian approach can reap the advantages of an efficient method that models all of the structure in the data while retaining desirable smoothing properties Non Bayesian non parametric methods often require additional ad hoc rules to avoid overfitting in

which resulting density approximates are nonsmooth With proper priors the Bayesian approach largely avoids overfitting while retaining flexibility This book provides methods for assessing informative priors that require only simple data normalizations The book also applies the mixture of the normals approximation method to a number of important models in microeconometrics and marketing including the non parametric and semi parametric regression models instrumental variables problems and models of heterogeneity In addition the author has written a free online software package in R bayesm which implements all of the non parametric models discussed in the book [Longitudinal Multivariate Psychology](#) Emilio Ferrer, Steven M. Bayesian Non-linear Methods for Survival Analysis and Structural Equation Models

Zhenyu Wang (Statistician), 2014. High-dimensional data are more common nowadays because the collection of such data becomes larger and more complex due to the technology advance of the computer science, biology, etc. The analysis of high-dimensional data is different from traditional data analysis and variable selection for high-dimensional data becomes very challenging. Structural equation modeling (SEM) analyzes the relationship between manifest variables and latent variables. The structural equation focuses on analyzing the relationship between latent variables. New proposed methods of these topics are discussed in the dissertation. In the first chapter, we review the basic concept of survival analysis, SEM, and current method of variable selection in those two scenarios. We also introduce the available software package for current methods and relevant data set. In the second chapter, we develop a Bayesian kernel machine model with incorporating existing information on pathways and gene networks in the analysis of DNA microarray data. Each pathway is modeled nonparametrically using reproducing kernel Hilbert space. The pathways and the genes are selected via assigning mixture priors on the pathway indicator variable and the gene indicator variable. This approach helped us in flexible modeling of the pathway effects which can capture both linear and non-linear effect. Moreover, the model can also pinpoint the important pathways and the important active genes within each pathway. We have also developed an efficient Markov Chain Monte Carlo (MCMC) algorithm to fit our model. We used simulations and a real data analysis: van't Veer et al. 2002 breast cancer microarray data to illustrate the proposed method. In the third chapter, we extend the idea of semiparametric structural equation model where the nonlinear functional relationships are approximated using basis expansions. Guo et al. 2012. Many basis expansion methods including cubic splines are known to induce correlations. In this chapter, we compare standard Lasso, Fused Lasso, and Elastic Net to account for correlations in both the covariate and basis expansions. To illustrate the usefulness of the proposed methods, a simulation study and a real data study have been performed. The semiparametric structural equation models based on Bayesian fused Lasso and Bayesian elastic net outperform the Bayesian Lasso model. In the fourth chapter, we apply Bayesian Graph Laplacian Model developed by Liu et al. 2014 and generalized the graph Laplacian allowing both positively and negatively correlated variable to analyze gene expression data from Michigan prostate cancer study (Dhanasekaran et al. 2001). We find out the underlying gene network and interaction related to prostate cancer and discuss the possible extensions for Bayesian Graph Laplacian Model including analyzing multiple pathways simultaneously and pathways selection, right censored data as response variable, and binomial or multinomial data as response variable.
