Passivation in Rare Earth Metal Chlorides--A New Conversion Coating Process for Aluminum Alloys F. Mansfeld, H. Shih, 1992 Investigations in this laboratory have shown that immersion of Al 6061 T6 and Al 7075 T6 in 1000 ppm CeCl₃ produces very corrosion resistant surfaces For Al 6061 T6 that had been treated in 1000 ppm CeCl₃ for one week pitting did not occur in 0.5N NaCl for two months Similar results have been obtained for immersion in NdCl₃ and PrCl₃ but not in LaCl₃ and YCl₃ The effects of the concentration of the passivation solutions the length of exposure time and type of surface preparation have been investigated in more detail using electrochemical impedance spectroscopy EIS and d.c. techniques EIS data and d.c. polarization curves have been determined during the passivation process and during subsequent exposure to NaCl In addition surface analysis has been performed using scanning electron microscopy with energy dispersive X ray analysis SEM EDAX and scanning Auger electron spectroscopy AES More recent efforts have concentrated on shortening the passivation time Comparisons with the corrosion behavior of chromate conversion coated aluminum alloys suggest that passivation in rare earth metal chlorides can produce surface films with a corrosion resistance similar to that provided by
