**What Is Life?** Ed Regis, 2009-05-01 Erwin Schrödinger's 1944 classic *What Is Life* is a small book that occupies a large place among the great written works of the twentieth century. It is said that it helped launch the modern revolution in biology and genetics and inspired a generation of scientists including Watson and Crick to explore the riddle of life itself. Now more than sixty years later, science writer Ed Regis offers an intriguing look at where this quest stands today. Regis ranges widely here, illuminating many diverse efforts to solve one of science's great mysteries. He examines the genesis of Schrödinger's great book, which first debuted as three public lectures in Dublin, and details the fantastic reception his ideas received both in Europe and America. Regis also introduces us to the work of a remarkable group of scientists who are attempting literally to create life from scratch, starting with molecular components that they hope to assemble into the world's first synthetic living cell. The book also examines how scientists have unlocked the three secrets of life, describes the key role played by ATP, the ultimate driving force of all life, and outlines the many attempts to explain how life first arose on earth, a puzzle that has given birth to a wide range of theories, which Francis Crick dismissed as too much speculation running after too few facts, from the primordial soup theory to the theory that life arose in clay in deep-sea vents or in oily bubbles at the seashore, right up to Freeman Dyson's theory of double origins. Written in a lively and accessible style and bringing together a wide range of cutting-edge research, *What Is Life* makes an illuminating contribution to this ancient and ever-fascinating debate.

**Creation** Steve Grand, 2000     *Life Itself*, 1988     *A Brief History of Creation* Bill Mesler, James H. Cleaves, 2015-12-08

The epic story of the scientists through the ages who have sought answers to life's biggest mystery: How did it begin? How did life begin? It is perhaps the most important question science has ever asked. Over the centuries, the search for an answer has been entwined with some of science's most revolutionary advances, including van Leeuwenhoek's microscope, Darwin's theory of evolution, and Crick and Watson's unveiling of DNA. Now, in an age of genetic engineering and space exploration, some scientists believe they are on the verge of creating life from nonliving elements, and that our knowledge of the potential for life on other planets is ever expanding. In the midst of these exciting developments, *A Brief History of Creation* provides an essential and illuminating history of Western science, tracing the trials and triumphs of the iconoclastic scientists who have sought to uncover the mystery of how life first came to be. Authors Bill Mesler and H. James Cleaves II examine historical discoveries in the context of philosophical debates, political change, and our evolving understanding of the complexity of biology. The story they tell is rooted in metaphysical arguments, in a changing understanding of the age of the Earth, and even in the politics of the Cold War. It has involved exploration into the inner recesses of our cells and scientific journeys to the farthest reaches of outer space. This elegantly written narrative culminates in an analysis of modern models for life's genesis, such as the possibility that some of the earliest life was composed of little more than RNA, and that life arose around deep-sea hydrothermal vents or even on other planets, only to be carried to the Earth on meteorites. Can we ever conclusively prove how life began? *A Brief History of Creation* is a fascinating exploration not only of the origin-of-life question but of the very

nature of scientific objectivity and the process of scientific discovery      Creation Adam Rutherford (Ph. D.),2013      Life Itself Francis Crick,1981      *Darwin Devolves* Michael J. Behe,2019-02-26 The scientist who has been dubbed the Father of Intelligent Design and author of the groundbreaking book *Darwin's Black Box* contends that recent scientific discoveries further disprove Darwinism and strengthen the case for an intelligent creator In his controversial bestseller *Darwin's Black Box* biochemist Michael Behe challenged Darwin's theory of evolution arguing that science itself has proven that intelligent design is a better explanation for the origin of life In *Darwin Devolves* Behe advances his argument presenting new research that offers a startling reconsideration of how Darwin's mechanism works weakening the theory's validity even more A system of natural selection acting on random mutation evolution can help make something look and act differently But evolution never creates something organically Behe contends that Darwinism actually works by a process of devolution damaging cells in DNA in order to create something new at the lowest biological levels This is important he makes clear because it shows the Darwinian process cannot explain the creation of life itself A process that so easily tears down sophisticated machinery is not one which will build complex functional systems he writes In addition to disputing the methodology of Darwinism and how it conflicts with the concept of creation Behe reveals that what makes Intelligent Design unique and right is that it acknowledges causation Evolution proposes that organisms living today are descended with modification from organisms that lived in the distant past But Intelligent Design goes a step further asking what caused such astounding changes to take place What is the reason or mechanism for evolution For Behe this is what makes Intelligent Design so important      **Creation** Harold G.
