Architectures Manfred Nagl,Bernhard Westfechtel,2024-04-26 This textbook concentrates on processes activities and results related to software architectures It describes the separation of architecture artefacts corresponding to their nature their logical or their modeling level on one hand and at the same time emphasizes their integration based on their mutual relations Design or development processes demand for integration as different artifacts must be elaborated which are mutually dependent and need to be in a consistent form The book is structured in four parts The introductory Part I deals with the relevance of architectures the central role of the design subprocess both in development or maintenance and the importance of the decisions and artefacts in the overall result Another topic is the spectrum of views an architecture language has to offer and that there are different architectures to be regarded from abstract and static to detailed technical and specific Part II then discusses important topics onthe architecture level It deals with adaptability especially for embedded systems with integrating styles pattern notations with different reuse forms and how to find them with the role of architectures for integrating different existing systems and with reverse and reengineering of legacy systems Next Part III covers architecture modeling and its relation to surrounding activities as well as architectures to surrounding other results The single chapters are on transformation between requirements and architectures architectures and programming architectures and project management and organization as well as architectures and their relations to quality assurance or documentation Eventually Part IV summarizes the main messages and presents open problems both for every single chapter and across chapters Every chapter focuses on a specific problem it addresses a question it answers the attention it demands a message it conveys and further open questions it raises The chapters are mostly independent which implies a certain redundancy yet it allows lecturers and their students to either use the book as the basis of teaching software architecture or design or to just pick those aspects that need special attention in a more advanced course **Automatic Parallelization** Christoph W. Kessler,2012-12-06 Distributed memory multiprocessing systems DMS such as Intel s hypercubes the Paragon Thinking Machine s CM 5 and the Meiko Computing Surface have rapidly gained user acceptance and promise to deliver the computing power required to solve the grand challenge problems of Science and Engineering These machines are relatively inexpensive to build and are potentially scalable to large numbers of processors However they are difficult to program the non uniformity of the memory which makes local accesses much faster than the transfer of non local data via message passing operations implies that the locality of algorithms must be exploited in order to achieve acceptable performance The management of data with the twin goals of both spreading the computational workload and minimizing the delays caused when a processor has to wait for non local data becomes of paramount importance When a code is parallelized by hand the programmer must distribute the program s work and data to the processors which will execute it One of the common approaches to do so makes use of the regularity of most numerical computations This is the so called Single Program Multiple Data SPMD or data parallel model of computation With this method the data arrays in the original program are each

distributed to the processors establishing an ownership relation and computations defining a data item are performed by the processors owning the data   *Generic Programming* Mehdi Jazayeri,Rüdiger G.K. Loos,David R. Musser,2000-09-20 This book constitutes the thoroughly refereed post proceedings of the International Seminar on Generic Programming held in Dagstuhl Castle Germany in April May 1998 The 20 revised full papers were carefully reviewed for inclusion in the book As the first book entirely devoted to the new paradigm of generic programming this collection offers topical sections on foundations and methodology comparisons programming methodology language design and applications   **Proceedings** ,2003 The ASE conference is the major conference for theory and practice concerned with automating the software development process Formerly known as Knowledge Based Software Engineering KBSE the conference expanded in order to reach out to other scientific communities concerned with the automation aspects of formal methods software process human computer interaction requirements engineering reverse engineering testing and verification and validation while still including an active artificial intelligence and knowledge based research focus   *ACM Transactions on Programming Languages and Systems* Association for Computing Machinery,2003 Contains articles on programming languages and their semantics programming systems storage allocations and garbage collection languages and methods for writing specifications testing and verification methods and algorithms specifically related to the implementation of language processors
