

Basic UV-Vis Theory, Concepts and Applications

For convenience of reference, definitions of the various spectral regions have been set by the Joint Committee on Nomenclature in Applied Spectroscopy:

Region	Wavelength (nm)
Far ultraviolet	10-200
Near ultraviolet	200-380
Visible	380-780
Near infrared	780-3000
Middle infrared	3000-30,000
Far infrared	30,000-300,000
Microwave	300,000-1,000,000,000

The human eye is only sensitive to a tiny proportion of the total electromagnetic spectrum between approximately 380 and 780 nm and within this area we perceive the colors of the rainbow from violet through to red. If the full electromagnetic spectrum shown in Figure 2 was redrawn on a linear scale and the visible region was represented by the length of one centimeter, then the boundary between radio and microwaves would have to be drawn approximately 25 kilometers away!

Radiation Sources

Besides the sun, the most conveniently available source of visible radiation with which we are familiar is the tungsten lamp. If the current in the circuit supplying such a lamp is gradually increased from zero, the lamp filament at first can be felt to be emitting warmth, then glows dull red and the gradually brightens until it is emitting an intense white light and a considerable amount of heat.

expanded greatly In addition to the identification and description of minerals it is becoming necessary to establish the relationships between structure composition and properties of minerals and their genesis their distribution within geological regions magmatic metamorphic and sedimentary formations and types of ore deposits The development of new methods of investigation requires an understanding of the physical meaning of the parameters under evaluation *Instrumentation Technology* ,1969 Space-time Information Processing Alan A.
