Decoding Dtmf Filters In The Frequency Domain:

The Nonuniform Discrete Fourier Transform and Its Applications in Signal Processing Sonali Bagchi, Sanjit K. Mitra, 2012-12-06 The growth in the field of digital signal processing began with the simulation of continuous time systems in the 1950s even though the origin of the field can be traced back to 400 years when methods were developed to solve numerically problems such as interpolation and integration During the last 40 years there have been phenomenal advances in the theory and application of digital signal processing In many applications the representation of a discrete time signal or a system in the frequency domain is of interest To this end the discrete time Fourier transform DTFT and the z transform are often used In the case of a discrete time signal of finite length the most widely used frequency domain representation is the discrete Fourier transform DFT which results in a finite length sequence in the frequency domain The DFT is simply composed of the samples of the DTFT of the sequence at equally spaced frequency points or equivalently the samples of its z transform at equally spaced points on the unit circle The DFT provides information about the spectral contents of the signal at equally spaced discrete frequency points and thus can be used for spectral analysis of signals Various techniques commonly known as the fast Fourier transform FFT algorithms have been advanced for the efficient computation of the DFT An important tool in digital signal processing is the linear convolution of two finite length signals which often can be implemented very efficiently using the DFT

Nonuniform Sampling Farokh Marvasti, 2012-12-06 Our understanding of nature is often through nonuniform observations in space or time In space one normally observes the important features of an object such as edges The less important features are interpolated History is a collection of important events that are nonuniformly spaced in time Historians infer between events interpolation and politicians and stock market analysts forecast the future from past and present events extrapolation The 20 chapters of Nonuniform Sampling Theory and Practice contain contributions by leading researchers in nonuniform and Shannon sampling zero crossing and interpolation theory Its practical applications include NMR seismology speech and image coding modulation and coding optimal content array processing and digital filter design It has a tutorial outlook for practising engineers and advanced students in science engineering and mathematics It is also a useful reference for scientists and engineers working in the areas of medical imaging geophysics astronomy biomedical engineering computer graphics digital filter design speech and video processing and phased array radar

Signal Analysis Ronald L. Allen, Duncan Mills, 2004-05-24 Offers a well rounded mathematical approach to problems in signal interpretation using the latest time frequency and mixed domain methods Equally useful as a reference an up to date review a learning tool and a resource for signal analysis techniques Provides a gradual introduction to the mathematics so that the less mathematically adept reader will not be overwhelmed with instant hard analysis Covers Hilbert spaces complex analysis distributions random signals analog Fourier transforms and more
