Water and Wastewater Treatment: Advanced Oxidation Processes Leila Thomson, 2023-09-26 Water and wastewater treatment involves the use of one or more physical chemical and biological processes or their combination for removing solids and organic matter from the wastewater Advanced oxidation processes AOPs are a set of chemical treatment procedures designed for effectively removing organic pollutants from water and wastewater by the process of oxidation This emerging chemical technology is based on the in situ generation of hydroxyl radicals which are used as strong oxidants that can be used to oxidize a wide range of chemical compounds In some AOPs sulphate radicals ozone catalyst or ultraviolet irradiation is also used to achieve more efficient treatment AOP is beneficial for cleaning biologically toxic or non degradable materials such as aromatics pesticides petroleum constituents and volatile organic compounds dissolved in the wastewater A major advantage of using AOPs for wastewater treatment is that these processes do not introduce any new hazardous substances into the water since the complete reduction product of hydroxyl radicals is water One drawback of AOPs that limit its large scale application and industrial usage relates to high costs This book unravels the recent studies on water and wastewater treatment using the advanced oxidation process Researchers and students in this field will be greatly assisted by it

Applications of Advanced Oxidation Processes in Wastewater Treatment David R. Dixon,2009 *An Innovative Approach of Advanced Oxidation Processes in Wastewater Treatment* Maulin P. Shah,2021 In recent decades scientific insight into the chemistry of water has increased enormously leading to the development of advanced wastewater and water purification technologies However the quality of freshwater resources has continually deteriorated worldwide both in industrialized

countries and in developing countries Although traditional wastewater technologies are focused on the removal of suspended solids nutrients and bacteria hundreds of organic pollutants occur in wastewater and affected urban surface waters These new pollutants are synthetic or naturally occurring chemicals that are not often monitored in the environment but have the potential to penetrate the environment and cause known or suspected adverse ecological and or human health effects These contaminants are collectively referred to as the Emerging Contaminants and are mostly derived from domestic use and occur in trace concentrations ranging from pico to micrograms per litre Environmental contaminants are recalcitrant for conventional wastewater treatment processes and most of them remain unaffected leading to the contamination of receiving water This scenario leads to the need for an advanced wastewater treatment process that can remove environmental contaminants to safely monitor fresh water sources This book explains the technologies of biological and chemical wastewater treatment processes The biological wastewater treatment processes presented include 1 bioremediation of wastewater that includes aerobic treatment oxidation ponds aerating lagoons aerobic bioreactors active sludge percolation or drip filters biological filters rotating biological contactors biological removal of nutrients and anaerobic treatment anaerobic bioreactors anaerobic lagoons 2 phytoremediation of waste water consisting of engineered wetlands rhizofiltration rhizodegradation phytodegradation phytoaccumulation Phyto transformation and hyperaccumulators and 3 mycoremediation of wastewater The chemical wastewater treatment processes discussed include chemical precipitation coagulation flocculation ion exchange neutralization adsorption and disinfection chlorination dechlorination ozone UV light In addition this chapter explains the wastewater treatment plants and illustrates them in terms of plant size plant layout and plant design and installation location
