Economic Wealth Creation and the Social Division of Labour Robert P. Gilles, 2019-02-09 This is the second book of a two volume set that continues Adam Smith's work using the tools mathematical experimental and behavioural economists have developed since 1776 As in the first volume markets are not the central organising principle Instead attention centres on social institutions and the division of labour that they enable The book studies this via the endogenous division of labour that existing institutions help form The first book in the series examined this problem deeply resorting minimally to formal mathematical modelling the second volume is where the formal modelling blossoms General equilibrium theory meets network theory and receives a breath of fresh air including a new viewpoint on economic inequality the newly resurgent bane of capitalism What I said for the first volume applies to this second volume equally if you care to understand the economy this book belongs to your bookshelf Dimitrios Diamantaras Temple University Philadelphia USA This textbook introduces and develops new tools to understand the recent economic crisis and how desirable economic policies can be adopted Gilles provides new institutional concepts for wealth creation such as network economies which are based on the social division of

labour This second volume introduces mathematical theories of the endogenous formation of social divisions of labour through which economic wealth is created Gilles also investigates the causes of inequality in the social division of labour under imperfectly competitive conditions These theories frame a comprehensive innovative and consistent perspective on the functioning of the twenty first century global economy explaining many of its failings Suitable reading for advanced undergraduate MSc and postgraduate students in microeconomic analysis economic theory and political economy
