Are stock prices related to the price of gold? Is unemployment related to inflation? Is the amount of money spent on research and development related to a company's next month's revenues? If correlations can answer these questions, and there is one statistical technique more useful at times, almost than correlations.

Correlation is a statistical method that determines the degree of relationship between two different variables. It is often known as a "bivariate" statistic, with the meaning two (and various) measuring variables or variables. The two variables are usually a pair of scores for a person or object. The relationship between any two variables can vary from strong to weak or none. When a relationship is strong, this means that knowing a person's or object's score on one variable helps to predict their score on the second variable; in other words, if a person has a high score on variable A (compared to all the other people's scores on A), then they are likely to have a high score on variable B (compared to the other people's scores on B). The latter would be considered a strong positive correlation. If the correlation or relationship between variable A and B is a weak one, then knowing a person's score on variable A does not help to predict their score on variable B. One very nice feature of the correlation coefficient is that it can only range from -1.00 to $+1.00$. Any values outside this range are invalid. Here is a graph:
