

Chapter 9: Cellular Respiration and Fermentation 9.1

How is the chemical energy stored in food used to generate ATP, the molecule that drives most cellular work?

-Plant and animal cells break down organic molecules by cellular respiration in the *mitochondria*.

-The chemical energy in food is transformed into chemical energy in ATP.

-Some energy is released to the environment as *heat*.

Concept 9.1: Catabolic pathways yield energy by *oxidizing* organic fuels

-Energy will enter the ecosystem as light and exit as heat.

-The chemical elements essential to life are recycled, such as → Photosynthesis uses CO₂ and H₂O to make organic molecules and O₂

-Cellular respiration uses O₂ and organic molecules to make ATP; CO₂ and H₂O are produced as waste.

-Catabolic Pathways release stored energy by breaking down complex molecules.

Electron transfer from food molecules to other molecules plays a significant role in these pathways.

-These processes are central to cellular respiration.

Catabolic Pathways and Production of ATP

-The Breakdown of organic molecules is exergonic.

-**Fermentation** is a partial degradation of Sugars that occurs without oxygen.

-**Aerobic Respiration** consumes organic molecules and oxygen and yields ATP.

-Anaerobic respiration is similar to aerobic respiration but consumes compounds other than oxygen.

-**Cellular Respiration** includes both aerobic and anaerobic respiration but is often used to refer to aerobic respiration.

-Though Carbohydrates, fats, and proteins are all consumed as fuel, it is helpful to trace cellular respiration with sugar glucose.
