- Selection Coefficient - to quantify the strength of natural selection against allele  $A_2$ , used as a parameter.
- Frequency-independent selection - fitness associated with a trait is not directly dependent on the frequency of the trait in a population.
- Directional selection - the most straightforward type of frequency-independent
- Fixation - in population genetics, an allele is said to go to fixation in a population when it replaces all alternative alleles at the same locus; that is when its frequency reaches 1.
- Overdominance - the condition wherein a heterozygote produces a phenotype more extreme or better than that of the homozygote.
- Heterozygous Advantage - describes the case in which the heterozygote genotype has a higher relative fitness than either the homozygote dominant or homozygote recessive genotype.
- Balanced polymorphism - a phenomenon by which more than one morph exists in the population at a stable frequency at a given time.
- Balancing selection - occurs when multiple alleles are maintained in a population.
- Underdominance - a form of frequency-independent selection in which the heterozygote genotype has lower fitness than either corresponding homozygote genotype.
