

Enzymes

- the chemistry of life is organized into metabolic pathways
- all metabolic pathways consist of a series of reactions which convert one molecule (the reactant) into another (the product)
- a specific enzyme catalyzes each step of the pathway
- 2 types of pathways:
 - Catabolic pathways**
 - release energy by breaking down complex molecules to simpler compounds
 - cellular respiration
 - Anabolic pathways**
 - consume energy to build complicated molecules from simpler compounds
 - synthesis of protein from amino acids
- chemical reactions can be classified as either exergonic or endergonic based on the change in energy that occurs because of the reaction
 - endergonic reaction - absorbs energy
 - exergonic reaction - releases energy

Energy in chemical reactions

- many chemical reactions occur spontaneously in cells but at very slow rates
 - enzymes lower energy barriers
 - act as a **catalyst**
 - speeds up** rate of reaction
 - is **not consumed** in the process
- the initial investment of energy for starting a reaction is the activation energy (E_a)
 - this is the amount of energy necessary to push the reactants over an energy barrier so that the reaction can proceed
 - heat would speed up reactions, but it would also denature proteins and kill cells
 - enzymes lower E_a

General Catalogue of Printed Books British Museum. Department of Printed Books, 1969 Introduction to Enzyme and Coenzyme Chemistry T. D. H. Bugg, 2012-08-13 Enzymes are giant macromolecules which catalyse biochemical reactions They are remarkable in many ways Their three dimensional structures are highly complex yet they are formed by spontaneous folding of a linear polypeptide chain Their catalytic properties are far more impressive than synthetic catalysts which operate under more extreme conditions Each enzyme catalyses a single chemical reaction on a particular chemical substrate with very high enantioselectivity and enantiospecificity at rates which approach catalytic perfection Living cells are capable of carrying out a huge repertoire of enzyme catalysed chemical reactions some of which have little or no precedent in organic chemistry The popular textbook Introduction to Enzyme and Coenzyme Chemistry has been thoroughly updated to include information on the most recent advances in our understanding of enzyme action with additional recent examples from the literature used to illustrate key points A major new feature is the inclusion of two colour figures and the addition of over 40 new figures of the active sites of enzymes discussed in the text in order to illustrate the interplay between enzyme structure and function This new edition provides a concise but comprehensive account from the perspective of organic chemistry what enzymes are how they work and how they catalyse many of the major classes of enzymatic reactions and will continue to prove invaluable to both undergraduate and postgraduate students of organic bio organic and medicinal chemistry chemical biology biochemistry and biotechnology **An Introduction to Enzyme Chemistry** P. F. Leadlay, 1978 This monograph provides a concise account of the extent to which an enzyme's catalytic function can now be related to its detailed structure The Enzyme Molecule W. Ferdinand, 1976 Written for use as a textbook for undergraduate courses on enzymology this book covers bioenergetics protein structure enzyme structure and function kinetics of independent active sites kinetics of interacting sites and metabolic control *The Chemistry of Enzyme Action*, 1983-12-01 The Chemistry of Enzyme Action **An Introduction to Enzyme and Coenzyme Chemistry** Tim Bugg, 2000 *Enzyme Intelligence and Whence and Whither* Nels Quevli, 1925 *General chemistry of the enzymes* Hans von Euler, 1912 **Chemistry of Enzymes** A.n.
