March 18, 2016

This is a collection of additional exercises, meant to supplement those found in the book *Convex Optimization*, by Stephen Boyd and Lieven Vandenberghe. These exercises were used in several courses on convex optimization, EE364a (Stanford), EE236b (UCLA), or 6.975 (MIT), usually for homework, but sometimes as exam questions. Some of the exercises were originally written for the book, but were removed at some point. Many of them include a computational component using CVX, a Matlab package for convex optimization; files required for these exercises can be found at the book web site www.stanford.edu/~boyd/cvxbook/. We are in the process of adapting many of these problems to be compatible with two other packages for convex optimization: CVXPY (Python) and Convex.jl (Julia). Some of the exercises require a knowledge of elementary analysis.

You are free to use these exercises any way you like (for example in a course you teach), provided you acknowledge the source. In turn, we gratefully acknowledge the teaching assistants (and in some cases, students) who have helped us develop and debug these exercises. Pablo Parrilo helped develop some of the exercises that were originally used in 6.975.

Course instructors can obtain solutions by email to us. Please specify the course you are teaching and give its URL.

We'll update this document as new exercises become available, so the exercise numbers and sections will occasionally change. We have categorized the exercises into sections that follow the book chapters, as well as various additional application areas. Some exercises fit into more than one section, or don't fit well into any section, so we have just arbitrarily assigned these.

Additional Exercises For Convex Optimization Solutions:

Convex Optimization Theory Dimitri Bertsekas, 2009-06-01 An insightful concise and rigorous treatment of the basic theory of convex sets and functions in finite dimensions and the analytical geometrical foundations of convex optimization and duality theory Convexity theory is first developed in a simple accessible manner using easily visualized proofs Then the focus shifts to a transparent geometrical line of analysis to develop the fundamental duality between descriptions of convex functions in terms of points and in terms of hyperplanes Finally convexity theory and abstract duality are applied to problems of constrained optimization Fenchel and conic duality and game theory to develop the sharpest possible duality results within a highly visual geometric framework This on line version of the book includes an extensive set of theoretical problems with detailed high quality solutions which significantly extend the range and value of the book The book may be used as a text for a theoretical convex optimization course the author has taught several variants of such a course at MIT and elsewhere over the last ten years It may also be used as a supplementary source for nonlinear programming classes and as a theoretical foundation for classes focused on convex optimization models rather than theory It is an excellent supplement to several of our books Convex Optimization Algorithms Athena Scientific 2015 Nonlinear Programming Athena Scientific 2017 Network Optimization Athena Scientific 1998 Introduction to Linear Optimization Athena Scientific 1997 and Network Flows and Monotropic Optimization Athena Scientific 1998

Nonlinear Programming Dimitri Bertsekas, 2016-09-01 This book provides a comprehensive and accessible presentation of algorithms for solving continuous optimization problems It relies on rigorous mathematical analysis but also aims at an intuitive exposition that makes use of visualization where possible It places particular emphasis on modern developments and their widespread applications in fields such as large scale resource allocation problems signal processing and machine learning The 3rd edition brings the book in closer harmony with the companion works Convex Optimization Theory Athena Scientific 2009 Convex Optimization Algorithms Athena Scientific 2015 Convex Analysis and Optimization Athena Scientific 2003 and Network Optimization Athena Scientific 1998 These works are complementary in that they deal primarily with convex possibly nondifferentiable optimization problems and rely on convex analysis By contrast the nonlinear programming book focuses primarily on analytical and computational methods for possibly nonconvex differentiable problems It relies primarily on calculus and variational analysis yet it still contains a detailed presentation of duality theory and its uses for both convex and nonconvex problems This on line edition contains detailed solutions to all the theoretical book exercises Among its special features the book Provides extensive coverage of iterative optimization methods within a unifying framework Covers in depth duality theory from both a variational and a geometric point of view Provides a detailed treatment of interior point methods for linear programming Includes much new material on a number of topics such as proximal algorithms alternating direction methods of multipliers and conic programming Focuses on large scale optimization topics of much current interest such as first order methods incremental

methods and distributed asynchronous computation and their applications in machine learning signal processing neural network training and big data applications Includes a large number of examples and exercises Was developed through extensive classroom use in first year graduate courses

Design of Modern Heuristics Franz Rothlauf, 2011-07-17 Most textbooks on modern heuristics provide the reader with detailed descriptions of the functionality of single examples like genetic algorithms genetic programming tabu search simulated annealing and others but fail to teach the underlying concepts behind these different approaches The author takes a different approach in this textbook by focusing on the users needs and answering three fundamental questions First he tells us which problems modern heuristics are expected to perform well on and which should be left to traditional optimization methods Second he teaches us to systematically design the right modern heuristic for a particular problem by providing a coherent view on design elements and working principles Third he shows how we can make use of problem specific knowledge for the design of efficient and effective modern heuristics that solve not only small toy problems but also perform well on large real world problems This book is written in an easy to read style and it is aimed at students and practitioners in computer science operations research and information systems who want to understand modern heuristics and are interested in a guide to their systematic design and use This book is written in an easy to read style and it is aimed at students and practitioners in computer science operations research and information systems who want to understand modern heuristics and are interested in a guide to their systematic design and use This book is written in an easy to read style and it is aimed at students and practitioners in computer science operations research and information systems who want to understand modern heuristics and are interested in a guide to their systematic design and use

Computer Age Statistical Inference, Student Edition Bradley Efron, Trevor Hastie, 2021-06-17 The twenty first century has seen a breathtaking expansion of statistical methodology both in scope and influence Data science and machine learning have become familiar terms in the news as statistical methods are brought to bear upon the enormous data sets of modern science and commerce How did we get here And where are we going How does it all fit together Now in paperback and fortified with exercises this book delivers a concentrated course in modern statistical thinking Beginning with classical inferential theories Bayesian frequentist Fisherian individual chapters take up a series of influential topics survival analysis logistic regression empirical Bayes the jackknife and bootstrap random forests neural networks Markov Chain Monte Carlo inference after model selection and dozens more The distinctly modern approach integrates methodology and algorithms with statistical inference Each chapter ends with class tested exercises and the book

concludes with speculation on the future direction of statistics and data science

Introduction to Civil Engineering

Systems Samuel Labi, 2014-04-07 This book presents an integrated systems approach to the evaluation analysis design and maintenance of civil engineering systems Addressing recent concerns about the world's aging civil infrastructure and its environmental impact the author makes the case for why any civil infrastructure should be seen as part of a larger whole He walks readers through all phases of a civil project from feasibility assessment to construction to operations explaining how to evaluate tasks and challenges at each phase using a holistic approach Unique coverage of ethics legal issues and management is also included

Routing, Flow, and Capacity Design in Communication and Computer Networks Michal Pioro, Deep Medhi, 2004-07-21 In network design the gap between theory and practice is woefully broad This book narrows it comprehensively and critically examining current network design models and methods You will learn where mathematical modeling and algorithmic optimization have been under utilized At the opposite extreme you will learn where they tend to fail to contribute to the twin goals of network efficiency and cost savings Most of all you will learn precisely how to tailor theoretical models to make them as useful as possible in practice Throughout the authors focus on the traffic demands encountered in the real world of network design Their generic approach however allows problem formulations and solutions to be applied across the board to virtually any type of backbone communication or computer network For beginners this book is an excellent introduction For seasoned professionals it provides immediate solutions and a strong foundation for further advances in the use of mathematical modeling for network design Written by leading researchers with a combined 40 years of industrial and academic network design experience Considers the development of design models for different technologies including TCP IP IDN MPLS ATM SONET SDH and WDM Discusses recent topics such as shortest path routing and fair bandwidth assignment in IP MPLS networks Addresses proper multi layer modeling across network layers using different technologies for example IP over ATM over SONET IP over WDM and IDN over SONET Covers restoration oriented design methods that allow recovery from failures of large capacity transport links and transit nodes Presents at the end of each chapter exercises useful to both students and practitioners

Structural Optimization Gianantonio Sacchi, 1985 After the IUTAM Symposium on Optimization in Structural Design held in Warsaw in 1973 it was clear to me that the time had come for organizing into a consistent body of thought the enormous quantity of results obtained in this domain studied from so many different points of view with so many different methods and at so many levels of practical applicability My colleague and friend Gianantonio Sacchi from Milan and I met with Professor Prager in Savognin in July 1974 where I submitted to them my first ideas for a treatise on structural optimization It should cover the whole domain from basic theory to practical applications and deal with various materials various types of structures various functions required of the structures and various types of cost Obviously this was to be a team effort to total three or four volumes to be written in a balanced manner as textbooks and handbooks Nothing similar existed at that time and indeed nothing has been published to date Professor Prager was immediately in favor of such a project He agreed to write a first part on optimality criteria with me and to help me in the general organization of the series Since Professor Sacchi was willing to write the text on variational methods it remained to find authors for parts on the mathematical programming approach to structural optimization and more generally on numerical methods and on practical optimal design procedures in metal and concrete
