**Iris Recognition** Fouad Sabry,2024-05-05 What is Iris Recognition Iris recognition is an automated method of biometric identification that uses mathematical pattern recognition techniques on video images of one or both of the irises of an

individual's eyes whose complex patterns are unique, stable and can be seen from some distance. The discriminating powers of all biometric technologies depend on the amount of entropy they are able to encode and use in matching. Iris recognition is exceptional in this regard, enabling the avoidance of collisions even in cross comparisons across massive populations. Its major limitation is that image acquisition from distances greater than a meter or two or without cooperation can be very difficult. However, the technology is in development and iris recognition can be accomplished from even up to 10 meters away or in a live camera feed.
