

Earthworm Dissection

External Observation

- 1. Examine your earthworm and determine the dorsal (back) and ventral (belly) sides. Note the swelling of the earthworm near its anterior side (front) - this is the **clitellum**. The anterior (front) of the animal is more cylindrical than the flattened posterior and is the closest to the clitellum. The ventral surface of the earthworm is usually a lighter color than the dorsal surface. The mouth is located on the ventral surface of the first segment while the anus is found at the end of the last segment.
- 2. Locate the dark line that runs down the dorsal side of the worm, this is the **dorsal blood vessel**. The **ventral blood vessel** can be seen on the underside of the worm, though it is usually not as dark.
- 3. Run your fingers over the ventral surface of the earthworm's body. You should be able to feel bristle-like setae used for locomotion.
- 4. Locate the worm's mouth and anus.

- 5. Among the earthworm's structural adaptations are its setae. How do you think the earthworm's setae make it well adapted to its habitat?

Internal Observation

- 1. Place the specimen in the dissecting pan **DORSAL** side up.
- 2. Locate the clitellum and insert the tip of the scissors about 3 cm.
- 3. Cut carefully all the way up to the head. Try to keep the scissors pointed up, and only cut through the skin.
- 4. Spread the skin of the worm out, use a needle to gently tear the **septa** (the cross-like structures that hold the skin together before it). Place pins in the skin to hold it open.

Reproductive System

- 1. The first structures you probably see are the **seminal vesicles**. They are cream colored and located toward the anterior of the worm. These are used for producing sperm. Use tweezers to remove these white structures from over the top of the digestive system (that lies underneath it).
