User subroutine to redefine field variables at a material point.

### Overview

---

User subroutine [USDFLD](#):

- allows you to define field variables at a material point as functions of time or of any of the available material point quantities listed in the Output Variable Identifiers table (["Abaqus/Standard output variable identifiers," Section 4.2.1 of the Abaqus Analysis User's Manual](#)) except the user-defined output variables UVARM and UVARMX;
- can be used to introduce solution-dependent material properties since such properties can easily be defined as functions of field variables;
- will be called at all material points of elements for which the material definition includes user-defined field variables;
- must call utility routine GETVRM to access material point data;
- can use and update state variables; and
- can be used in conjunction with user subroutine UFIELD to prescribe predefined field variables.

### Explicit solution dependence

---

Since this routine provides access to material point quantities only at the start of the increment, the solution dependence introduced in this way is explicit: the material properties for a given increment are not influenced by the results obtained during the increment. Hence, the accuracy of the results depends on the size of the time increment. Therefore, you can control the time increment in this routine by means of the variable PNEWDT.

### Defining field variables

---

Before user subroutine [USDFLD](#) is called, the values of the field variables at the material point are calculated by interpolation from the values defined at the nodes. Any changes to the field variables in the user subroutine are local to the material point: the nodal field variables retain the values defined as initial conditions, predefined field variables, or in user subroutine UFIELD. The values of the field variables defined in this routine are used to calculate values of material properties that are defined to depend on field variables and are passed into other user subroutines that are called at the material point, such as the following:

Advanced Timber Structures Yves Weinand, 2016-12-19 Wood is usually perceived as a traditional material. However, the properties of this material have now for some time made it possible to design free shapes and highly complex structures. Today, the wood laboratory of the EPF Lausanne, which was originally founded by Julius Natterer, is testing the production of origami structures, ribbed shells, fabric structures, and curved panels under the guidance of Professor Weinand using digital calculation and computer-aided processing methods. The research results are tested in prototypes which demonstrate the potential applications in large-scale timber buildings. By exploring the hitherto unused potential of wood as a construction material, this book provides an exciting and inspiring outlook on a new generation of timber buildings. *Proceedings of the ASME Design Engineering Division ...*, 2004     **ABAQUS/Explicit**, 1998     Structures innovantes en bois Yves Weinand, 2017-10-10 Holz wird meist als traditioneller Werkstoff wahrgenommen.
