Abstract: The close formation flight of UAV's has many significant advantages over single vehicle flight. The aerodynamic stability analysis of two heterogeneous UAV's in close formation flight is detailed in the present paper. The issues of altitude changes and the associated shifts or changes in centre of gravity or moments, the equivalent actuator control surface deflections etc., are explained with the help of simulations. The short period frequency variations with these changes are also correlated with the help of pole-zero diagrams.

Keywords: Control, Close Formation Flight, Heterogeneous UAV's, Wing Vortex

1. Introduction

The Close Formation Flight (CFF) of Unmanned Aerospace Vehicles (UAV's) has diverse advantages such as fuel saving, cost reduction and preciseness in image capturing and data collection etc. The formation flight studies of heterogeneous Unmanned Aerial Vehicles (UAV's) in a stability analysis view point is hardly difficult to find. The proposed formation flight model in this paper consists of two members, namely 'leader' and 'follower'. The induced drag reduction caused by vortex effect of leader wing tips in close formation is made use of in this stability analysis work.

2. Literature Review

The most important control techniques used among available literature spanned over the last two decades are Intelligent Management Control Approach [1], Co-operative Control [2], Constraint Forces Approach [3], 3D Potential Field Approach [4], Co-operative tracking control [5], Constrained Adaptive Back-stepping Approach [6] and Vision based Scheme [7]. Proud, A. et al formulated PID feedback tracking control on two member system [8]. Dogan et al presented Linear Control Approach for formation reconfiguration [9]. Vanek and Balint applied Model

Predictive Control/or real-time trajectory tracking of UAV formations [10]. Model Predictive Control Algorithm in non-linear dynamics is implemented by Saffarian and Fahimi [11]. The Decentralized Control Design Procedure for obstacle avoidance and collision is done by Haibo Min [12]. The aerodynamics associated with wing vortex effect and the resulting drag reduction is of special focus on the studies of P. Chichka et al. [13]. The simulation of aerodynamic cross-coupling vortex effects [14] is a useful reference for the present study.

After a brief review of relevant literature the stability analysis of two heterogeneous UAV's engaged in close formation flight and their associated aerodynamic interactions are detailed in section-III. The formation consensus of these UAV's from different altitude levels for drag reduction results in centre of gravity (c. g.) shifts and moment changes are quantitatively estimated and simulated in section-IV. These c. g. shifts and moment changes produces short period roots or frequency transitions, as illustrated by a pole-zero diagram at the end before conclusion. The aero stability analysis of the mechanical characteristics of two heterogeneous fixed-wing UAV's during a transformation to a close formation flight is highlighted in the present paper.

different nonconventional aircrafts are analyzed a V shape morphing wings and a Linked UAV system A modern adaptation of Prandtl's liftingline method is utilized to analyze the aerodynamics of both systems This method can compute the aerodynamic forces for a system of lifting surfaces with arbitrary camber sweep dihedral position and orientation The V shape morphing wings consist of a wing configuration that has two panels an out of plane dihedral section and a horizontal section An analysis of the aircraft turning dynamics shows that by manipulating the dihedral angles of the V shape wings either by symmetric or asymmetric wing shape changes can affect the turning capabilities of an aircraft to perform a variety of different missions depending on the importance of each of the turning performance measurements A linked UAV concept where individual UAVs link at high altitude creates an aerodynamically efficient system of aircraft which has long endurance capabilities and can cruise for extended periods with significantly reduced power loads This dissertation presents an analysis of close proximity aerodynamics and aircraft dynamics of two Linked UAVs As the UAVs approach each other for wingtip docking there are strong aerodynamic coupling between their wings tips An aerodynamic disturbance intensity field has been generated utilizing both simulation and wind tunnel data to determine a trajectory for the two UAVs to approach each other for midair docking Finally two optimal trajectories a 2 D and 3 D docking trajectories are generated and compared Dynamic wind tunnel test are performed to compare different midair wingtip docking trajectories The results of the optimization concludes that a trajectory with a span wise approach is more desirable since it goes through the least aerodynamic disturbances and requires less control effort to perform the midair docking maneuver

Rivera Parga, 2004-12-01 The Air Force Research Lab Munitions Directorate Flight Vehicles Integration Branch AFRL MNAV developed a man portable carbon fiber matrix UAV with a flexible rectangular wing of 24 span and 6 chord 18.2 length. There is a need for the development of smaller and lighter UAVs to perform certain missions. The objective of this experimental study was to determine the behavior and the aerodynamic characteristics of rotary tails. The bird inspired rotary tail mechanism studied enabled control of two degrees of freedom and was configured to provide elevator deflection and rotation. Its effects on the static stability and control effectiveness were measured using the Air Force Institute of Technology AFIT low speed wind tunnel. The yaw moment provided by each rotary tail was found to be on the same order of magnitude as a typical rudder and in that respect it offers promise as an effective flight control scheme. However, it was also found that the side force and consequently the yaw moment generated by the two tail controls, elevator deflection and rotation, were strongly coupled, which could lead to challenging aircraft control issues. A benefit is that the configurations used in this thesis would reduce the storage length by 48%.
