Processor Description Languages Prabhat Mishra, Nikil Dutt, 2011-07-28 Efficient design of embedded processors plays a critical role in embedded systems design Processor description languages and their associated specification exploration and rapid prototyping methodologies are used to find the best possible design for a given set of applications under various design constraints such as area power and performance This book is the first comprehensive survey of modern architecture description languages and will be an invaluable reference for embedded system architects designers developers and validation engineers Readers will see that the use of particular architecture description languages will lead to productivity gains in designing particular application specific types of embedded processors Comprehensive coverage of all modern architecture description languages use the right ADL to design your processor to fit your application Most up to date information available about each architecture description language from the developers save time chasing down reliable documentation Describes how each architecture description language enables key design automation tasks such as simulation synthesis and testing fit the ADL to your design cycle

Parallel Programming Thomas Rauber, Gudula Rünger, 2010-03-16 Innovations in hardware architecture like hyper threading or multicore processors mean that parallel computing resources are available for inexpensive desktop computers In only a few years many standard software products will be based on concepts of parallel programming implemented on such hardware and the range of applications will be much broader than that of scientific computing up to now the main application area for parallel computing Rauber and Rünger take up these recent developments in processor architecture by giving detailed

descriptions of parallel programming techniques that are necessary for developing efficient programs for multicore processors as well as for parallel cluster systems and supercomputers Their book is structured in three main parts covering all areas of parallel computing the architecture of parallel systems parallel programming models and environments and the implementation of efficient application algorithms The emphasis lies on parallel programming techniques needed for different architectures The main goal of the book is to present parallel programming techniques that can be used in many situations for many application areas and which enable the reader to develop correct and efficient parallel programs Many examples and exercises are provided to show how to apply the techniques The book can be used as both a textbook for students and a reference book for professionals The presented material has been used for courses in parallel programming at different universities for many years
