Concrete Mix Design

Introduction

The process of selecting suitable ingredients of concrete and determining their relative amounts with the objective of producing a concrete of the required, strength, durability, and workability as economically as possible, is termed the concrete mix design. The proportioning of ingredient of concrete is governed by the required performance of concrete in 2 states, namely the plastic and the hardened states. If the plastic concrete is not workable, it cannot be properly placed and compacted. The property of workability, therefore, becomes of vital importance.

The compressive strength of hardened concrete which is generally considered to be an index of its other properties, depends upon many factors, e.g. quality and quantity of cement, water and aggregates; batching and mixing; placing, compaction and curing. The cost of concrete is made up of the cost of materials, plant and labour. The variations in the cost of materials arise from the fact that the cement is several times costly than the aggregate, thus the aim is to produce as lean a mix as possible. From technical point of view the rich mixes may lead to high shrinkage and cracking in the structural concrete, and to evolution of high heat of hydration in mass concrete which may cause cracking.

The actual cost of concrete is related to the cost of materials required for producing a minimum mean strength called characteristic strength that is specified by the designer of the structure. This depends on the quality control measures, but there is no doubt that the quality control adds to the cost of concrete. The extent of quality control is often an economic compromise, and depends on the size and type of job. The cost of labour depends on the workability of mix, e.g., a concrete mix of inadequate workability may result in a high cost of labour to obtain a degree of compaction with available equipment.

Requirements of concrete mix design

The requirements which form the basis of selection and proportioning of mix ingredients are :

- a) The minimum compressive strength required from structural consideration
- b) The adequate workability necessary for full compaction with the compacting equipment available.
- c) Maximum water-cement ratio and/or maximum cement content to give adequate durability for the particular site conditions
- d) Maximum cement content to avoid shrinkage cracking due to temperature cycle in mass concrete.

Types of Mixes

1. Nominal Mixes

In the past the specifications for concrete prescribed the proportions of cement, fine and coarse aggregates. These mixes of fixed cement-aggregate ratio which ensures adequate strength are termed nominal mixes. These offer simplicity and under normal circumstances, have a margin of strength above that specified. However, due to the variability of mix ingredients the nominal concrete for a given workability varies widely in strength.

2. Standard mixes

The nominal mixes of fixed cement-aggregate ratio (by volume) vary widely in strength and may result in

Sharma, Arun Goel, Pankaj Munjal, 2023-06-10

Sustainable development of smart cities infrastructures is of paramount importance and need to be planned, designed, constructed, operated and de-commissioned in a manner that ensures economic, social, environmental and institutional sustainability over the entire infrastructure life cycle. Smart cities infrastructure, however, be cost-effective, disaster resilient, environmentally friendly, conserving natural resources and sustainable, ensuring faster delivery of quality and durable structures which include roads, building bridges, energy and water infrastructures. Government of India is going to encourage Public Private Partnership (PPP) as an alternate option to build most of the infrastructures which can be useful both for green field as well as brown field smart cities projects. The present book is a collection of contributed research and review papers presented at the National Conference on Sustainable Development of Smart Cities Infrastructure (SDSCI 2023) held at National Institute of Technology Kurukshetra in May 2023. The subject matter is grouped into nine sessions which include:

- research articles pertaining to sustainable development of smart cities
- urban and rural planning
- transportation
- built environment and management
- sustainable and smart technologies
- materials
- construction and maintenance
- advance modelling
- characterization of structures
- energy and environment
- performance of smart cities infrastructure under extreme loading conditions
- green buildings
- structural health monitoring
- and ICT in smart cities
- data mining and machine learning for sustainable infrastructure
- GIS and remote sensing
- future trends and prospects of smart cities
- innovative technologies
- building energy and efficiency
- and sobriety and sustainable resilience to natural and man-made disasters
- and smart materials etc.

The book would be a valuable reference for researchers, students, structural designers, site engineers and all related engineers involved in the field of sustainable development of smart cities infrastructure. **The Indian Trade Journal**, 1957. *Programme 2nd International CIB/RILEM Symposium on Moisture Problems in Buildings* International CIB/RILEM Symposium on Moisture Problems in Buildings (2nd : 1974 : Rotterdam), 1974.
